 IDENTIFIERS Mathematics Education Research; *National Assessment of Educational Progress

ABSTRACT

This report presents the mathematics assessment results from the 1992 National Assessment of Educational Progress (NAEP). The assessment included nearly 250,000 fourth-, eighth-, and twelfth-grade students attending approximately 10,000 schools across the nation and the states. Students' performance is categorized into three achievement levels: Basic, Proficient, and Advanced. Among the major findings were that: (1) for the nation there were statistically significant increases in average mathematics proficiency in all grades and in both public and private schools from 1990 to 1992; (2) despite these positive findings, 60 percent of the students in grades 4, 8, and 12 were estimated to be at or above the Basic level on the 1992 mathematics assessment; (3) considerable variation in performance existed within and across states and territories; (4) increases in mathematics proficiency between 1990 and 1992 did little to alter the relative standings of the demographic groups; (5) gains were noted in the content areas of numbers and operations, measurement, geometry, data analysis, and algebra, and (6) one-fifth of the 4th graders, two-thirds of the 8th graders, and 90 percent of the 12th graders demonstrated ability in solving two-step problems involving multiplication and division. Chapter 1 contains overall achievement results for the states by grade and by state. Chapter 2 contains results for the nation and states by the demographic groups of race/ethnicity (White, Black, Hispanic, Asian/Pacific Islander, American Indian); gender; type of community (advantaged urban, disadvantaged urban, extreme rural, and other); parents' highest level of education; and type of school (public, Catholic, private). Chapter 3 contains national and state mathematical content areas of estimation, numbers and operations, measurement, geometry, statistics, algebra, and functions. The four appendices, one-third of the document, discuss NAEP's anchor-level results, the guidelines for sample participation, state contextual background factors, and an overview of the procedures used in the 1992 mathematics assessments. (MDH)

NAEP 1992 Mathematics Report Card for the Nation and the States

What is The Nation's Report Card?

THE NATION'S REPORT CARD, the National Assessment of Educational Progress (NAEP), is the only nationally representative and continuing assessment of what America's students know and can do in various subject areas. Since 1969, assessments have been conducted periodically in reading, mathematics, science, writing, history/geography, and other fields. By making objective information on student performance available to policymakers at the national, state, and local levels, NAEP is an integral part of our nation's evaluation of the condition and progress of education. Only information related to academic achievement is collected under this program. NAEP guarantees the privacy of individual students and their families.

NAEP is a congressionally mandated project of the National Center for Education Statistics, the U.S. Department of Education. The Commissioner of Education Statistics is responsible, by law, for carrying out the NAEP project through competitive awards to qualified organizations. NAEP reports directly to the Commissioner, who is also responsible for providing continuing reviews, including validation studies and solicitation of public comment, on NAEP's conduct and usefulness.

In 1988, Congress created the National Assessment Governing Board (NAGB) to formulate policy guidelines for NAEP. The board is responsible for selecting the subject areas to be assessed, which may include adding to those specified by Congress; identifying appropriate achievement goals for each age and grade; developing assessment objectives; developing test specifications; designing the assessment methodology; developing guidelines and standards for data analysis and for reporting and disseminating results; developing standards and procedures for interstate, regional, and national comparisons; improving the form and use of the National Assessment; and ensuring that all items selected for use in the National Assessment are free from racial, cultural, gender, or regional bias.

EXECUTIVE SUMMARY

The results from NAEP's 1992 mathematics assessment indicate that student performance is improving nationally and in some states, but that a considerable challenge remains. Proportions of students at the higher achievement levels continue to be low, particularly for those subpopulations of students historically considered to be "at risk."

MAJOR FINDINGS

- ▶ For the nation, there were statistically significant increases in average mathematics proficiency between 1990 and 1992 for fourth-, eighth-, and twelfth-grade students, both public and private schools combined. Eighteen of 37 states and territories that participated in the grade 8 Trial State Assessment Program in both 1990 and 1992 showed significantly increased average mathematics proficiency for their public-school students.
- ▶ Despite these positive findings, just over 60 percent of the students in grades 4, 8, and 12 were estimated to be at or above the Basic level on the 1992 mathematics assessment. At this level, students should exhibit partial mastery of the knowledge and skills fundamental for proficient work.

Nationally, across the three grades, 25 percent or fewer were estimated to be at the Proficient level or beyond, where students should exhibit evidence of solid academic performance. The percentages of students attaining the Advanced level, where students should exhibit superior performance, ranged from an estimated 2 to 4 percent.

- ▶ Within and across participating states and territories, there was considerable variation in performance. At grade 4, the percentages of students estimated to be at the Basic level or beyond ranged from 25 to 76 percent, while those at grade 8 ranged from 13 to 82 percent. The percentages of fourth and eighth graders estimated to be at or above the Proficient level ranged from 5 to 25 percent and from 1 to 37 percent, respectively. From 0 to 6 percent of the fourth and eighth graders were estimated to have attained the Advanced level.
- ▶ The states with the highest average mathematics proficiency at grade 4 included Maine, Iowa, New Hampshire, Wisconsin, North Dakota, Minnesota, New Jersey, Connecticut, Massachusetts, and Nebraska. At grade 8, the top-performing states included Iowa, North Dakota, Minnesota, Maine, New Hampshire, Wisconsin, and Nebraska.
- ▶ The Southeast continued to trail behind the Northeast, Central, and West at all three grades assessed.
- ▶ Asian/Pacific Islander and White students had higher average mathematics proficiency than did Black students, with American Indian and Hispanic students performing somewhere in between. Two-thirds or more of the Asian/Pacific Islander and White students were estimated to have achievement at or above the Basic level, while fewer than one-half of the American Indian, Black,

and Hispanic students demonstrated achievement at the partial mastery level.

- ▶ Gender differences were not large, but males tended to outperform female students at grade 12. For example, 18 percent of the males were estimated to be at or above the Proficient level compared to 14 percent of the females.
- ▶ The increases in mathematics proficiency between 1990 and 1992 for the nation and in many states did little to alter the relative standings of the demographic groups.
 - ▶ Average performance increased for White students at all three grades. The only other statistically significant gains in average mathematics proficiency by racial/ethnic group were found for Black and Hispanic students at grade 12.
 - ▶ Average mathematics proficiency for both males and females increased at all three grades.
 - ▶ Students attending schools in the top one-third of the performance distribution showed increased mathematics proficiency at all three grades. The only gain for students attending schools in the bottom one-third of the distribution occurred at grade 12.
- ▶ A number of gains were noted for the nation and the states in the mathematics content areas assessed by NAEP, including Numbers and Operations, Measurement, Geometry, Data Analysis/Statistics, and Algebra.
- ▶ Seventy-two percent of the fourth graders and nearly all of the eighth and twelfth graders were estimated to have shown some success in addition, subtraction, and simple problem solving with whole numbers.

- ▶ Approximately one-fifth of the fourth graders, two-thirds of the eighth graders, and 90 percent of the twelfth graders were estimated to have also demonstrated ability in solving two-step problems involving multiplication and division.
- ▶ One-fifth and one-half of the students at grades 8 and 12, respectively, were estimated to have solved problems involving fractions, decimals, and percents as well as elementary concepts in geometry, statistics, and algebra.
- ▶ Only 6 percent of the high-school seniors and 1 percent of the eighth graders were estimated to have demonstrated consistent success in the areas of geometric relationships, algebra, and functions.

The Scope of NAEP's 1992 Mathematics Assessment

NAEP's 1992 mathematics assessment included nearly 250,000 fourth-, eighth-, and twelfth-grade students attending approximately 10,000 schools across the nation and the states. The assessment itself was forward-looking, comprising several hundred questions at each of the grades assessed. Consistent with standards developed by the National Council of Teachers of Mathematics, many questions required students to construct their responses and some questions asked for explanations of their reasoning. For various portions of the assessment, mathematical tools and aids were supplied, including scientific calculators, protractor/rulers, and geometric shapes. One portion was administered using a special audiotape to pace students through estimation questions.

Nationally representative samples of students attending both public and private schools were assessed at grades 4, 8, and 12. In addition, representative samples of fourth and eighth graders attending public schools were assessed in each of 44 jurisdictions. Thus, tables containing only national data present results for public- and private-school students combined, whereas tables containing state data present results only for public-school students.

These participants include:

Alabama	Louisiana	Ohio
Arizona	Maine	Oklahoma
Arkansas	Maryland	Pennsylvania
California	Massachusetts	Rhode Island
Colorado	Michigan	South Carolina
Connecticut	Minnesota	Tennessee
Delaware	Mississippi	Texas
District of Columbia	Missouri	Utah
Florida	Nebraska	Virginia
Georgia	New Hampshire	West Virginia
Hawaii	New Jersey	Wisconsin
Idaho	New Mexico	Wyoming
Indiana	New York	
Iowa	North Carolina	Guam
Kentucky	North Dakota	Virgin Islands*

* The Virgin Islands participated in the testing portion of the 1992 Trial State Assessment Program. However, in accordance with the legislation providing for participants to review and give permission for release of their results, the Virgin Islands chose not to release their results at grade 4 in the national composite report.

Trend results from a comparable assessment conducted in 1990 are available for the nation and for the 37 states and territories (noted above in bold-faced type) that participated in both the 1990 and 1992 programs at grade 8. NAEP's Trial State Assessment Program was begun in 1990 at grade 8 and expanded in 1992 to include both grades 4 and 8.

Achievement Levels

As part of its statutory responsibilities, the National Assessment Governing Board (NAGB) established three achievement levels for reporting NAEP results: Basic, Proficient, and Advanced. The Basic level denotes partial mastery of the knowledge and skills fundamental for Proficient work at each grade. Proficient, the central level, represents solid academic performance and demonstrated competence over challenging subject matter. This is the achievement level the Board has determined all students should reach. The Advanced level signifies superior performance beyond Proficient. The process of setting achievement levels incorporated the views of a broadly representative body of teachers, administrators, and interested members of the public, and enables NAEP data to be reported in terms of what students *should* be able to do.

TABLE 1 presents average mathematics proficiency and performance for the achievement levels at grades 4, 8, and 12 for both 1992 and 1990. The improvement in mathematics performance between 1990 and 1992 is clear. However, more than one-third of the students at all three grades did not reach the lowest level of performance, and no statistically significant increases were found at the Advanced level. The cutpoints for the achievement levels on NAEP's 0 to 500 mathematics proficiency scale are shown in TABLE 2.

TABLE 1 National Overall Average Mathematics Proficiency and Achievement Levels, Grades 4, 8, and 12

Grades	Assessment Years	Average Proficiency	Percentage of Students At or Above			Percentage Below Basic
			Advanced	Proficient	Basic	
4	1992	218(0.7)>	2(0.3)	18(1.0)>	61(1.0)>	39(1.0)<
	1990	213(0.9)	1(0.4)	13(1.1)	54(1.4)	46(1.4)
8	1992	268(0.9)>	4(0.4)	25(1.0)>	63(1.1)>	37(1.1)<
	1990	263(1.3)	2(0.4)	20(1.1)	58(1.4)	42(1.4)
12	1992	299(0.9)>	2(0.3)	16(0.9)	64(1.2)>	36(1.2)<
	1990	294(1.1)	2(0.3)	13(1.0)	59(1.5)	41(1.5)

>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level.

< The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

TABLE 2 Mathematics Proficiency (Scale-Score Cutpoint) Corresponding to Each Achievement Level, Grades 4, 8, and 12

Grades	Advanced	Proficient	Basic
4	280	248	211
8	331	294	256
12	366	334	287

Comparable information for students attending schools ranked by their students' achievement on the assessment is found in TABLE 3. Students in the top one-third of the schools outperformed their counterparts in the bottom one-third of schools by substantial margins, and they showed more improvement between the 1990 and 1992 assessments, especially at grades 4 and 8.

TABLE 3 Average Mathematics Proficiency and Achievement Levels for the Top One-Third of the Schools and the Bottom One-Third of the Schools, Grades 4, 8, and 12

				Percentage of Students At or Above			
	Assessment Years	Percent of Students	Average Proficiency	Advanced	Proficient	Basic	Percentage Below Basic
<u>Grades 4</u>							
Top One-Third Schools	1992 1990	34(2.8) 34(3.9)	237(0.8)> 229(1.4)	5(0.8) 3(1.1)	34(1.5)> 25(2.6)	84(1.0)> 76(1.8)	16(1.0)< 24(1.8)
Bottom One-Third Schools	1992 1990	29(2.1) 30(3.4)	196(1.2) 194(1.7)	0(0.1) 0(0.2)	4(0.5) 4(0.9)	32(1.5) 29(2.5)	68(1.5) 71(2.5)
<u>Grades 8</u>							
Top One-Third Schools	1992 1990	29(3.1) 30(4.4)	289(1.3)> 280(1.2)	8(1.1) 5(1.0)	45(2.0)> 35(2.0)	86(1.5)> 78(1.7)	14(1.5)< 22(1.7)
Bottom One-Third Schools	1992 1990	32(1.8) 34(3.9)	245(0.9) 244(1.8)	0(0.3) 0(0.3)	8(0.8) 8(1.3)	37(1.4) 36(2.0)	63(1.4) 64(2.0)
<u>Grades 12</u>							
Top One-Third Schools	1992 1990	35(3.1) 34(5.0)	316(1.1)> 310(1.2)	4(0.7) 4(0.9)	29(1.5) 23(2.3)	82(1.3)> 77(1.8)	18(1.3)< 23(1.8)
Bottom One-Third Schools	1992 1990	27(2.2) 26(3.3)	279(1.0)> 274(1.5)	0(0.2) 0(0.2)	5(0.9) 3(0.9)	40(1.6) 35(2.7)	60(1.6) 65(2.7)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

Average proficiency and achievement level data for the participating jurisdictions at grades 4 and 8 are presented in TABLE 4. Even though there was considerable variation in performance across the states, the results tend to parallel those of the nation. Percentages of students reaching the Advanced and Proficient achievement levels remain low, although progress was made between 1990 and 1992 at grade 8. (Please note that the national and regional results included in TABLE 4 and in other tables containing state data will differ from those provided for the entire sample of private- and public-school students as shown in TABLE 5. To be comparable to the data for states and territories, the national and regional results in these tables are based only on students attending public schools.)

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated. (xxx) Did not participate in the 1990 Trial State Assessment.

Overall Mathematics Performance for the States

FIGURES 1 and 3 provide a method for making appropriate comparisons in overall average mathematics proficiency across the states, the District of Columbia, and territories participating in NAEP's 1992 mathematics assessment. The jurisdictions are listed by overall average mathematics proficiency. To find out how any one jurisdiction performed in comparison to the other jurisdictions, find the name of the state or territory across the top of the chart and read down that column. As can be seen, the pattern for most states is one of having lower average proficiency than some states, about the same average proficiency as some states, and higher average proficiency than some states.

FIGURES 2 and 4 provide visual representations of percentile results for the participating jurisdictions. For example, 25 percent of the students in each state performed below the 25th percentile, and 75 percent performed above the 25th percentile. For the 90th percentile, 10 percent performed above that level and 90 percent below. The dark boxes at the midpoints of the distributions show the 95 percent confidence intervals around the average proficiencies. These intervals take into account the amount of sampling and measurement error associated with the estimates of average proficiency. The results across percentiles show great variation in students' achievement within each state, to the extent that differences within individual states across percentiles tended to exceed the differences in average performance across states.

FIGURE 5 displays the jurisdictions demonstrating increased average mathematics proficiency between 1990 and 1992. These 18 states and territories include: Arizona, Colorado, Connecticut, the District of Columbia, Hawaii, Idaho, Iowa, Kentucky, Minnesota, New Hampshire, New Mexico, North Carolina, Oklahoma, Rhode Island, Texas, Wyoming, Guam, and the Virgin Islands.

Comparisons of Overall Mathematics Average Proficiency 1992 Grade 4

THE NATION'S
REPORT
CARD

INSTRUCTIONS:

Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

FIGURE 2

Distribution of Overall Mathematics Proficiency Organized by Average Proficiency 1992 Grade 4

The center *darkest* box indicates a simultaneous confidence interval around the average mathematics proficiency for the state based on the Bonferroni procedure for multiple comparisons. Center boxes that do not overlap indicate significant differences between states in average mathematics proficiency. The *darker shaded* boxes indicate the ranges between the 25th and 75th percentiles of the mathematics proficiency distribution, and the *lighter shaded* boxes the ranges between the 5th to 25th percentiles and the 75th to 95th percentiles of the distribution.

Comparisons of Overall Mathematics Average Proficiency 1992 Grade 8

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

FIGURE 4

Distribution of Overall Mathematics Proficiency Organized by Average Proficiency 1992 Grade 8

The center *darkest* box indicates a simultaneous confidence interval around the average mathematics proficiency for the state based on the Bonferroni procedure for multiple comparisons. Center boxes that do not overlap indicate significant differences between states in average mathematics proficiency. The *darker shaded* boxes indicate the ranges between the 25th and 75th percentiles of the mathematics proficiency distribution, and the *lighter shaded* boxes the ranges between the 5th to 25th percentiles and the 75th to 95th percentiles of the distribution.

Figure 5

The NAEAP Trial State Assessment

Comparisons of Overall Mathematics Proficiency at Grade 8

1992 vs. 1990

State was significantly higher in 1992 than 1990
 No statistically significant difference from 1990 to 1992
 State did not participate in 1990 or 1992
 NOTE: No state was significantly lower in 1992 than 1990

Performance for Demographic Subpopulations

TABLE 5 presents trends in national average proficiency for demographic subpopulations defined by race/ethnicity, gender, type of community, and level of parents' education. The increases between 1990 and 1992 can be seen. However, performance gaps remain between various historically advantaged and disadvantaged groups. TABLE 6 presents average proficiency by race/ethnicity and gender for the states at grades 4 and 8 as well as trends between 1990 and 1992 at grade 8.

A Graphic Illustrating Students' Average Performance Across States

FIGURE 6 is designed to highlight the gradations of mathematics proficiency across the jurisdictions that participated in the 1992 NAEP Trial State Assessment Program. The chart shows those states in the top "quintile," or top 20 percent of performance, looking in particular at the overall average proficiency demonstrated by fourth- and eighth-grade males and females and Black, Hispanic, and White students.

States having average performance in the top 20 percent across participating jurisdictions are indicated by the darkest boxes, with states in successively lower quintiles shown by progressively lighter shadings. The data for the states and territories tend to parallel those for the nation. However, there are differences. Also, in comparison to other participating jurisdictions, some states and territories have certain subpopulations that performed better than others.

For example, West Virginia is in the bottom 20 percent of states in the average mathematics proficiency of White students, but in the top 20 percent in Black students' average proficiency. At the same time, West Virginia is in the next-to-bottom 20 percent for its female students' proficiency and in the middle 20 percent for the proficiency of its male and Hispanic students.

TABLE 5 Average Mathematics Proficiency by Gender, Race/Ethnicity, Type of Community, and Region

	Assessment Years	Grade 4	Grade 8	Grade 12
Male	1992 1990	220(0.8)> 214(1.2)	267(1.1)> 263(1.6)	301(1.1)> 297(1.4)
Female	1992 1990	217(1.0)> 212(1.1)	268(1.0)> 262(1.3)	297(1.0)> 292(1.3)
White	1992 1990	227(0.9)> 220(1.1)	277(1.0)> 270(1.4)	305(0.9)> 300(1.2)
Black	1992 1990	192(1.3) 189(1.8)	237(1.4) 238(2.7)	275(1.7)> 268(1.9)

American Indian	1992 1990	209(3.2) 208(3.9)	254(2.8) 246(9.4)	281(9.0) 288(10.2)!
Advantaged Urban	1992 1990	237(2.1) 231(3.0)	288(3.6) 280(3.2)	316(2.6) 306(6.2)
Disadvantaged Urban	1992 1990	193(2.8) 195(3.0)	238(2.6)< 249(3.8)!	279(2.4) 276(6.0)
Extreme Rural	1992 1990	216(3.6) 214(4.9)	267(4.6) 257(4.4)	293(1.9) 293(3.3)
Other	1992 1990	219(0.9)> 213(1.1)	268(1.1)> 262(1.7)	300(0.9)> 295(1.3)
Northeast	1992 1990	223(2.0)> 215(2.9)	269(2.7) 270(2.8)	302(1.5) 300(2.3)
Southeast	1992 1990	210(1.6)> 205(2.1)	260(1.4) 255(2.5)	291(1.4)> 284(2.2)
Central	1992 1990	223(1.9)> 216(1.7)	274(1.9)> 266(2.3)	303(1.8) 297(2.6)
West	1992 1990	218(1.5) 216(2.4)	268(2.0)> 261(2.6)	298(1.7) 294(2.6)

>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

Virgin Islands	221 (1.5)	222 (1.4)	*** (***)	224 (1.2)	213 (1.9)	*** (***)	*** (***)

The percentages for race, ethnicity may not add to 100 percent because some students categorized themselves as "other." »The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. «The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

FIGURE 6

Average Mathematics Proficiency by Gender and Race/Ethnicity for Five Performance Bands (Quintiles) 1992 Grades 4 and 8

States categorized in the bottom 20 percent of performance have average mathematics proficiencies in the lowest fifth of the average mathematics proficiency distribution of all states and are indicated by the number 1 (first quintile). States with average proficiencies in the top 20 percent of the distribution are indicated by the number 5 (fifth quintile). The numbers 2, 3, and 4 indicate states with average proficiencies in the second, third, and fourth fifths of the distribution.

X Sample size too small (fewer than 62 students) to permit reliable reporting of performance bands (quintiles).

NA Grade 4 data for the Virgin Islands are not available.

What Students Know and Can Do in Mathematics

In contrast to the achievement-level results, based on judgments of how much students *should* know or be able to do, NAEP anchor level results provide descriptions of the types of knowledge, mathematical abilities, and problem-solving skills that students display at particular intervals along NAEP's 0 to 500 point scale. More specifically, the empirically based descriptions are based on what students know and can do at one level that differentiates them from students performing at lower levels. The anchor-level results for the nation as well as for states and territories are shown in TABLES 7 and 8.

Although most students at all three grades demonstrated some success in solving problems involving addition and subtraction, performance began to drop off as the problems required multiplication and division or reasoning in situations involving more than one step or operation. It was estimated that

TABLE 7 National Overall Average Mathematics Proficiency and Anchor Levels, Grades 4, 8, and 12

		Assessment Years	Grade 4	Grade 8	Grade 12
Average Proficiency		1992	218(0.9)>	268(0.9)>	299(0.9)>
		1990	213(0.9)	263(1.3)	294(1.1)
Level	Description	Percentage of Students at or Above			
200	Addition and Subtraction, and Simple Problem Solving with Whole Numbers	1992	72(0.9)>	97(0.4)	100(0.1)
		1990	67(1.4)	95(0.7)	100(0.2)
250	Multiplication and Division, Simple Measurement, and Two-Step Problem Solving	1992	17(0.8)>	68(1.0)	91(0.5)>
		1990	12(1.1)	65(1.4)	88(0.9)
300	Reasoning and Problem Solving Involving Fractions, Decimals, Percents, and Elementary Concepts in Geometry, Statistics, and Algebra	1992	0(0.1)	20(0.9)>	50(1.2)>
		1990	0(0.1)	15(1.0)	45(1.4)
350	Reasoning and Problem Solving Involving Geometric Relationships, Algebra, and Functions	1992	0(0.0)	1(0.2)	6(0.5)
		1990	0(0.0)	0(0.2)	5(0.8)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated. (xxx) Did not participate in the 1990 Trial State Assessment.

even fewer students -- one-fifth at grade 8 and one-half at grade 12 -- had success with fractions, decimals, and percents or elementary geometry and algebra. Few students (an estimated 6 percent) at grade 12 consistently solved relatively complex problems involving geometric relationships, algebra, or functions.

TABLE 9 presents average performance across the five content areas included in the assessment, as well as for the special estimation section. TABLE 10 displays comparable information for the participating states and territories. The increases in average proficiency in algebra and functions across the nation and the states are consistent with recommendations included in the *NCTM Standards* to place more emphasis on algebra in school mathematics. FIGURE 7 shows the average proficiency in 20 percent bands or quintiles of state performance across the mathematics content areas. Students in Iowa, Maine, Minnesota, New Hampshire, North Dakota, and Wisconsin had average proficiency in the top 20 percent of participating jurisdictions across all mathematics content areas at both grades 4 and 8.

TABLE 9 Average Proficiency in Mathematics Content Areas, Grades 4, 8, and 12

Grade	Years	Average Proficiency	Numbers and Operations	Measurement	Geometry	Data Analysis, Statistics, and Probability	Algebra and Functions	Estimation
4	1992	218(0.7)>	216(0.8)>	224(0.8)>	221(0.7)>	219(0.9)	217(0.9)>	208(1.5)>
	1990	213(0.9)	210(1.1)	218(1.0)	213(0.9)	--	214(0.9)	200(1.5)
8	1992	268(0.9)>	272(0.8)>	266(1.2)>	263(0.9)>	268(1.1)>	267(1.0)>	271(1.3)
	1990	263(1.3)	267(1.3)	259(1.6)	260(1.3)	263(1.6)	261(1.2)	269(1.2)
12	1992	299(0.9)>	298(0.9)>	297(0.9)>	300(1.0)>	298(1.0)>	300(1.0)>	294(1.2)
	1990	294(1.1)	293(1.1)	292(1.3)	295(1.3)	294(1.2)	296(1.2)	292(1.2)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

TERRITORY						
Guam	188 (1.1)	192 (1.1)	201 (1.2)	189 (0.9)	192 (1.0)	173 (0.8)

The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

FIGURE 7

Average Proficiency by Mathematics Subscales for Five Performance Bands (Quintiles) 1992 Grades 4 and 8

States categorized in the bottom 20 percent of performance have average mathematics proficiencies in the lowest fifth of the average mathematics proficiency distribution of all states and are indicated by the number 1 (first quintile). States with average proficiencies in the top 20 percent of the distribution are indicated by the number 5 (fifth quintile). The numbers 2, 3, and 4 indicate states with average proficiencies in the second, third, and fourth fifths of the distribution.

NA Grade 4 data for the Virgin Islands are not available.

INTRODUCTION

The National Assessment of Educational Progress (NAEP) is a Congressionally mandated project of the National Center for Education Statistics (NCES) that has collected and reported information for nearly 25 years on what American students know and what they can do. It is the nation's only ongoing, comparable, and representative assessment of student achievement. Its tests are given to scientific samples of youths attending both public and private schools and enrolled in grades four, eight, or twelve. The test items are written around a framework prepared for each content area -- reading, writing, math, science, and others -- that represents the consensus of groups of curriculum experts, educators, members of the general public, and user groups on what should be covered on such a test. Reporting includes means and distributions of scores, as well as more descriptive information about the meaning of different points on the NAEP scale.

A Recent History of NAEP Reporting

Over time there have been many changes in emphasis of NAEP testing and reporting both to take advantage of new technologies and to reflect changing trends in education. In 1984, a new technology called Item Response Theory (IRT) made it possible to create "scale scores" for NAEP similar to those the public was accustomed to seeing for the annual Scholastic Aptitude Tests (SAT). Educational Testing Service, in its role as Government grantee carrying out NAEP operations, devised a new way to describe performance against this scale, called "anchor levels." Starting in 1984, NAEP results were reported by "anchor levels." Anchor levels describe distributions of performance at selected points along the NAEP scale (i.e., standard deviation units). Anchor levels show how groups of students perform relative to each other, but not whether this performance is adequate.

In 1988, Congress authorized a new aspect of NAEP that allowed states and territories to participate voluntarily in a trial state assessment, using samples representative of their own students, to provide state-level data comparable to

the nation and each of the other participating jurisdictions. Pursuant to that law, in 1990, the mathematics achievement of eighth graders was assessed in 40 jurisdictions (states, territories, and the District of Columbia). The results were reported in *The State of Mathematics Achievement: NAEP's 1990 Assessment of the Nation and the Trial State Assessment of the States*: (Washington, DC: National Center for Education Statistics, 1991).

In the same 1988 law, Congress established the National Assessment Governing Board (NAGB), assigning it broad policy making authority over NAEP, including the authority to take "appropriate actions . . . to improve the form and use of the National Assessment" and to identify "appropriate achievement goals for each . . . grade and subject area to be tested in the National Assessment." To carry out its responsibilities, NAGB developed achievement levels, which are collective judgments about how students perform, translated into ranges along the NAEP scale. The process was conducted for NAGB under contract by American College Testing (ACT), which has extensive experience in standard-setting in many fields. The standards setting process began with questions such as, "What *should* students know and be able to do if they are proficient in mathematics in the fourth, eighth, or twelfth grade?" The National Assessment Governing Board, after wide consultation including public hearings, developed statements to describe what students should know and be able to do at three levels of proficiency -- "Basic," "Proficient," and "Advanced" -- for each of the three NAEP grades. A panel of expert and broadly representative judges evaluated each NAEP item, judged the proportion of students at each level which should answer the items correctly, and made recommendations that resulted in points along the NAEP scale that corresponded with the minimum score for each of these levels.

In 1990, after Congress had mandated pilot testing at the State level to supplement what had only been conducted for the nation and four large regions, the more rigorous content of the mathematics standards prepared by the National Council of Teachers of Mathematics began to influence the NAEP frameworks.

Also in 1990, the President and the nations's 50 governors adopted six National Education Goals, including one that calls for American students to "leave grades 4, 8, and 12 having demonstrated competency in challenging subject matter, including English, mathematics, science, history, and geography." The adoption of this goal highlighted a perceived deficiency in the Nation's ability to report on the performance of students relative to standards developed through a consensus process.

A Transition Phase in Reporting

This 1992 mathematics report marks NCES's first attempt to shift to standards-based reporting of National Assessment statistics. The transition is being made now to report NAEP results by "achievement levels." Achievement levels describe how students should perform relative to a body of content reflected in the NAEP frameworks (i.e., how much students should know). The impetus for this shift lies in the belief that NAEP data will take on more meaning for the public if they show what proportion of our youth are able to meet standards of performance necessary for a changing world. Chapter 1 of the report describes how the 1992 standards were prepared and provides examples of test exercises that illustrate the mathematics content reflected in the descriptions of the NAEP achievement levels.

Reporting NAEP results on the basis of achievement levels represents a significant change in practice for NCES. On occasion, this agency makes use of emerging analytical approaches that permit new, and sometimes controversial, analyses to be done. Just as other statistical agencies do when introducing new measures to supplement or replace old measures, NCES has in this report provided the data according to the earlier procedures in addition to the new procedures. For this reason, in addition to NAEP results reported according to achievement levels, results according to the scale anchoring procedure that has been used since the 1984 assessment can be found in Appendix A to this report. Presenting the data both ways gives the public -- not just technical evaluators -- an opportunity to be informed, so that all data users will be able to assess for themselves how well the various forms of reporting and interpreting the data meet their needs.

Technical Review of NCES Reports

All reports published by NCES are evaluated through an adjudication procedure. This process represents a final quality control check designed to assure that all publications conform to statistical standards, are grounded in the data, and take into account relevant substantive research literature. The adjudication process also attempts to delete misleading interpretive statements and provide text that is clear and understandable to the American public. During the adjudication of this report neither the process for setting achievement levels developed by ACT nor the scores representing each level was addressed. The process and the cutpoints were taken as a given. The

issue of valid inferences was addressed, however. A number of reviewers interpreted statements about what students should do at the various achievement levels according to the standards set by NAGB as statements about what students can do. Independent studies are being conducted concerning the appropriate inferences that can be drawn from the NAEP results reported by achievement levels. Early results from technical evaluations suggested that this apparently logical step in interpretation might not be justified after closer examination of the data about what students at these levels actually demonstrate in terms of mathematical competencies. Discussion about the achievement levels also raised questions about the need for validity evidence for the anchor levels, as well as for greater understanding of the underlying assumptions of the process by which they were developed.¹

This issue led NCES to seek the advice of several technical committees and to convene a meeting of technical and policy experts. Members, staff, and contractors of the National Assessment Governing Board participated in this meeting. Altogether these activities provided a forum for discussion of various historical and proposed approaches to interpreting the NAEP scale. In order to better inform the public about these and other interpretation issues, a companion NCES report entitled *Interpreting NAEP Scales* (Washington, DC: National Center for Education Statistics, 1993) explains several approaches to reporting information from NAEP.

Actual Student Performance

Then the next question is: Through their performance on the NAEP items, what actual knowledge and abilities did students demonstrate? Chapters 1, 2, and 3 of this report include information on overall means and on distributions of scores, all taken directly from the test item data. The Appendix addresses this question in the manner that NAEP has used since 1985, using anchor points. As implemented for this report, the scale anchoring process provides a concise summary of what students know and can do at various points along the scale that differentiates them from students performing at lower levels. First, students performing at or around four intervals on the scale were identified (200, 250, 300, and 350 -- each of which is one standard deviation unit apart). Next, questions were identified that were answered correctly by 65 percent or more of the students at one level and by fewer than half of the

¹ Forsyth, R.A. (1991). Do NAEP scales yield valid criterion-referenced interpretations? *Education Measurement: Issues and Practice*, 10, 3-9, 16.

students at the next lower level. Finally, mathematics educators were asked to analyze each anchor-level question and create summary descriptors of the knowledge and skills evidenced by students who answered these sets of questions successfully. The critical distinction here is that anchor levels attempt to describe what students can do at and around selected points on the NAEP scale; achievement levels attempt to describe what students *should be able to do* in various ranges on the NAEP scale.

Future Work

These achievement level standards are in the second round (the first being in 1990) in a developmental process which has been revised and is still under review through several studies.^{2 3}

The Board's goal is to provide a statement of what American students should be able to do as a standard that can give more meaning to the NAEP data. They then want to use the NAEP data to inform the nation as to how many students actually can meet those standards.

NCES realizes that modifications and improvements may be necessary in the future as current procedures are evaluated and new approaches are considered. NCES conceives of this process as a research and developmental activity in which numerous statistical, psychometric, and substantive issues must be resolved. At the present time the effort is hampered by the problem of trying to create standards on a given framework and item pool developed for another purpose. In the future the measurement of standards will be a more prominent influence on the development of NAEP procedures.

The goal of the National Center for Education Statistics is to make data available for the public and to do so in accurate and understandable ways that are not misleading. In this case, much of what matters in NAEP is changing:

- ▶ the content in response to the developing standards of various curricular groups;

² *Assessing Student Achievement in the States*. The First Report of the National Academy of Education Panel on the Evaluation of the NAEP Trial State Assessment: 1990 Trial State Assessment. National Academy of Education, Stanford, CA: 1992.

³ Linn, R.L.; Koretz, D.M.; Baker, E.L.; and Burstein, L. The Validity and Credibility of the Achievement Levels for the 1990 National Assessment of Educational Progress in Mathematics, Technical Report CSE No. 330, Center for Research on Evaluation, Standards, and Student Testing, UCLA, (Los Angeles, CA: June 1991).

- ▶ the test items in response to new developments in assessments;
and
- ▶ the reporting in response to, and increasing interest in, student achievement relative to standards of student performance.

We believe that the numerous completed and ongoing studies will lead to national debate that will assure the public is well informed about these issues -- as informed they must be because the results will be a vital influence on what Americans come to think about the condition and progress of our schools.

In addition, the public needs the data in this report to see for themselves what standards-based reporting might do and to evaluate the often conflicting claims of adherents and detractors of these changes in approaches to reporting on the educational achievement of American students. The Center eventually wants to use the achievement levels to describe that students know and can do. In order to accomplish that, the frameworks, tests, and achievement levels may need to be developed in tandem. That is easier to say than to do, however, because it implies a substantially larger pool of test exercises, carefully designed to support reporting about performance relative to a set of performance standards. Clearly this is a developmental effort that will take time and several iterations, during which data supporting appropriate inferences about the performance of American students will continue to be gathered.

CHAPTER ONE

Overall Mathematics Achievement for the Nation and the States

Overview

The National Assessment of Educational Progress (NAEP) is a Congressionally mandated survey of the educational achievement of American students and of changes in that achievement across time. This report contains results from NAEP's 1992 mathematics assessment of nationally representative samples of public- and private-school students in grades 4, 8, and 12 and provides comparisons to the findings from a comparable survey conducted in 1990. It also contains state-level results for public-school students in grades 4 and 8 based on representative samples of each of the 44 jurisdictions that participated in NAEP's 1992 Trial State Assessment Program.

These participants include:

Alabama	Louisiana	Ohio
Arizona	Maine	Oklahoma
Arkansas	Maryland	Pennsylvania
California	Massachusetts	Rhode Island
Colorado	Michigan	South Carolina
Connecticut	Minnesota	Tennessee
Delaware	Mississippi	Texas
District of Columbia	Missouri	Utah
Florida	Nebraska	Virginia
Georgia	New Hampshire	West Virginia
Hawaii	New Jersey	Wisconsin
Idaho	New Mexico	Wyoming
Indiana	New York	
Iowa	North Carolina	Guam
Kentucky	North Dakota	Virgin Islands*

* The Virgin Islands participated in the testing portion of the 1992 Trial State Assessment Program. However, in accordance with the legislation providing for participants to review and give permission for release of their results, the Virgin Islands chose not to release their results at grade 4 in the national composite report.

The jurisdictions shown in bold-face type also participated in the 1990 Trial State Program in eighth-grade mathematics. Thus, trend results between 1990 and 1992 at grade 8 are also included for these 34 states, the District of Columbia, and two territories. The 1990 program included 37 states, the District of Columbia, and two territories. Three states -- Montana, Illinois, and Oregon -- participated in the 1990 trial state assessments, but not in the 1992 program.

Congress in 1988 authorized the additional dimension of state-level assessments for NAEP on a trial basis, which provided for voluntary participation by states and territories in 1990 and 1992. Designed to provide results that can be compared across the nation and participating jurisdictions, the trial program included eighth-grade mathematics in 1990 and 1992 as well as fourth-grade mathematics and reading in 1992.

In authorizing the legislation for the NAEP Trial State Assessment Program, Congress called for an independent evaluation of the feasibility and validity of the assessments and the fairness and accuracy of the data they produce. Thus, the various steps included in the program continue to be evaluated by an independent panel appointed by the National Academy of Education.⁴

The Mathematics Content Assessed in 1990 and 1992

With the advent of the Trial State Assessment Program, even greater care was taken to solicit widespread involvement and advice about the development and conduct of the 1990 mathematics assessment, and further improvements were made for 1992. The mathematics objectives framework underlying the assessments was developed under the auspices of the Council of Chief State School Officers (CCSSO) through a special NAEP Planning Project sponsored by the National Center for Education Statistics (NCES) and the National Science Foundation.⁵ Although those involved in the legislatively mandated consensus development process drew upon the available draft of the *Curriculum and Evaluation Standards for School Mathematics*, developed by the National Council of

⁴*Assessing Student Achievement in the States: The First Report of the National Academy of Education Panel on the Evaluation of the NAEP Trial State Assessment: 1990 Trial State Assessment* (Stanford, CA: National Academy of Education, Stanford University, 1992). A second report on the 1992 program is forthcoming in June 1993.

⁵*Mathematics Objectives, 1990 Assessment* (Princeton, NJ: National Assessment of Educational Progress, Educational Testing Service, 1988).

Teachers of Mathematics,⁶ the project involved widespread participation and review, including an objectives committee of mathematics educators; a steering committee with 18 members representing policymakers, practitioners, and citizens at large; distribution to the mathematics supervisors in the education agencies of all 50 states for review by state committees; reviews by mathematics scholars and NCES staff; and endorsement by the National Assessment Governing Board (NAGB) for both the 1990 and 1992 assessments.

The mathematics objectives were designed as a matrix comprising five broad content areas and three levels of mathematical ability. The five content areas are: numbers and operations; measurement; geometry; data analysis, statistics, and probability; and algebra and functions. The mathematical abilities are: conceptual understanding, procedural knowledge, and problem solving.

The 1990 assessment included a broad range of questions that required students to solve problems in both constructed-response and multiple-choice formats, provide responses using protractors/rulers, and use calculators (four-function at grade 4 and scientific at grades 8 and 12). For 1992, the assessments were expanded to include "manipulable" geometric shapes as well as questions that allowed students about five minutes to demonstrate -- in writing and diagrams -- their mathematical reasoning and problem-solving ability. In general, a greater emphasis was placed on questions asking students to construct their responses, and the proportion of multiple-choice questions was reduced. Also, a special component of the assessment in which students are led by audiotape through a series of tasks designed to measure their estimation skills (conducted only at the national level in 1990) was included in the state assessments in 1992. By pacing students through a series of problems, this portion of the assessment reveals whether students can provide reasonable estimates of answers without doing the actual computation. To supplement the achievement results, students, teachers, and school administrators were asked to complete questionnaires about their backgrounds and instructional practices in mathematics.

In both 1990 and 1992, identical assessment instruments were used in both the national and Trial State Assessments. A portion of the questions in the 1992 assessment were carried forward from 1990 to provide a basis for measuring trends between the two assessments.

The questions and background questionnaires were developed by staff and consultants at Educational Testing Service (ETS), which conducted the work under

⁶*Curriculum and Evaluation Standards for School Mathematics* (Reston VA: National Council of Teachers of Mathematics, 1989).

contract with NCES, with the guidance of panels of distinguished educators, and in accordance with the *ETS Standards for Quality and Fairness*.⁷ Subsequent to rigorous internal review, the NAEP materials were further reviewed by NCES, NAGB, and the Office of Management and Budget. All materials used in the Trial State Assessments were reviewed by state agency personnel (both mathematics and testing experts).

The Conduct of the 1990 and 1992 Assessments

As with all NAEP assessments, the schools and students participating in the 1990 and 1992 mathematics assessments were selected through scientifically designed stratified random sampling procedures. Approximately 26,000 fourth, eighth, and twelfth graders in 1,500 public and private schools across the country participated in the national assessment. For each jurisdiction participating in the Trial State Assessment Program, approximately 2,500 students were sampled from approximately 100 public schools for each grade and curriculum area. Thus, a total of approximately 220,000 fourth- and eighth-grade students attending nearly 9,000 public schools participated in the 1992 trial state assessments.

All NAEP data are collected by trained administrators. Data for the national assessment were collected by a field staff managed by the ETS subcontractor, Westat, Inc. However, in accordance with the NAEP legislation, data collection for the Trial State Assessment Program was the responsibility of each participating jurisdiction. Uniformity of procedures across states was achieved through training and quality control monitoring by Westat, Inc. In 1990, Westat staff trained about 4,000 state assessment administrators using a video presentation accompanied by a scripted trainer's guide and practice exercises. Parallel procedures were used in 1992 when Westat trained nearly 10,000 state personnel. Quality control was provided by unannounced, random monitoring of half the sessions in each state. The results of the monitoring in 1990 and 1992 indicated a high degree of quality and uniformity across sessions.

The materials, including approximately two million written responses constructed by students in 1990 and four million in 1992, were scored by a second subcontractor, National Computer Systems, and the results were analyzed by Educational Testing Service. As expected, numerous quality control steps were undertaken to ensure the accuracy of the results. Throughout, NCES and its contractors worked closely with the Trial State Assessment NETWORK, which

⁷*ETS Standards for Quality and Fairness* (Princeton, NJ): Educational Testing Service, 1987).

includes representatives from all interested states. Federal funding permitted state education personnel to meet with staff members from NCES, the contractors, NAGB, and CCSSO at NETWORK meetings regularly held to review NAEP materials and procedures.

Orientation to This Report

This report is one of a series, which taken in its entirety is designed to provide a comprehensive account of the results from NAEP 1992 mathematics assessment and how the 1992 and 1990 results compare. It focuses on the achievement data, whereas subsequent reports will describe other results, including students' responses to the constructed-response questions and the relationships between achievement and background factors. The complete results for the nation and the states are contained in the *Data Compendium from the 1992 Mathematics Assessment*. Also, a separate report tailored for each participating state highlights the state's results compared to national and regional performance.

The assessment results were analyzed to determine the percentage of students responding correctly to each question and item response theory (IRT) methods were used to summarize results for each of the five mathematics content areas in the framework. An overall composite scale was then developed by weighting each content area according to its importance in the objectives.⁸ The composite scale is the main mechanism used in this report to compare overall achievement across grades, to determine educational progress between 1990 and 1992, to compare results across demographic subpopulations, and to compare states to each other and the nation.

Average proficiency on the NAEP scale provides an overall depiction of students' mathematics achievement; however, by itself, it does not describe what students know and are able to do in mathematics, nor does it evaluate students' performance against a standard. In this report, the interpretations of the NAEP scale are based primarily on three achievement levels -- *Basic*, *Proficient*, and *Advanced* -- developed by NAGB to inform policymakers and the public about what students should know and be able to do on the NAEP assessments. Rather than focusing only on the most advanced students or defining a single minimal level of achievement, the Board wanted to provide standards for assessing a broad spectrum of performance. Performance at the *Basic* level denotes partial mastery of the knowledge and skills fundamental for proficient work at each

⁸More detailed information on the NAEP scaling procedures can be found in Appendix D, including the weightings by content area used to create the overall scale.

grade level but is not deemed satisfactory. The central level, *Proficient*, represents solid academic performance at each grade level assessed. Achievement at the *Advanced* level signifies superior performance at the grades assessed. Full definitions of these levels are presented below. To carry out the task of applying these standards to the 1992 mathematics assessment, NAGB contracted with American College Testing to undertake advisory and analytic functions that could assist the Board in forming its conclusions as to appropriate achievement levels.⁹

Definitions of Achievement Levels

Basic. This level, below proficient, denotes partial mastery of knowledge and skills that are fundamental for proficient work at each grade -- 4, 8, and 12. For 12th grade, this is higher than minimum competency skills (which normally are taught in elementary and junior high schools) and covers significant elements of standard high-school-level work.

Proficient. This central level represents solid academic performance for each grade tested -- 4, 8, and 12. It reflects a consensus that students reaching this level have demonstrated competency over challenging subject matter and are well prepared for the next level of schooling. At grade 12, the proficient level encompasses a body of subject-matter knowledge and analytical skills, of cultural literacy and insight, that all high school graduates should have for democratic citizenship, responsible adulthood, and productive work.

Advanced. This higher level signifies superior performance beyond proficient grade-level mastery at grades 4, 8, and 12. For 12th grade, the advanced level shows readiness for rigorous college courses, advanced technical training, or employment requiring advanced academic achievement. As data become available, it may be based in part on international comparisons of academic achievement and may also be related to Advanced Placement and other college placement exams.

⁹Appendix D provides more information about the process of gathering expert judgments about Basic, Proficient, and Advanced performance -- as defined by NAGB policy -- on each mathematics item, combining the various judgments on the various items and mapping them onto the scale, and setting the scale-score cutpoints for reporting purposes based on these levels.

Although achievement levels were reported on a trial basis for the 1990 mathematics assessment,¹⁰ the primary way of interpreting the NAEP scale for that assessment was based on describing what students know and can do at four anchor levels of the scale -- 200, 250, 300, and 350.¹¹ Scale anchoring provides empirically-based descriptions of the types of procedural knowledge, mathematical skills, and problem-solving abilities demonstrated by students who answer questions correctly at each level. For purposes of comparison to 1990, the 1992 anchor-level results are provided in Appendix A.¹² These two ways of interpreting NAEP scales (together with several other methods) are thoroughly reviewed and contrasted in *Interpreting NAEP Scales*.¹³ It is important to note, however, that because improvements in both the achievement levels-setting process and NAEP scaling procedures were implemented in 1992 and applied to the 1990 data for trend purposes, the 1990 results in this report will differ from those in earlier reports for both the achievement-level and anchor-level results.

The remainder of Chapter One contains the overall average mathematics proficiency results and the percentages of students at each grade performing at or above the three achievement levels for the nation, the regions of the country, and the states for both 1990 and 1992. Comparisons among the states based on overall average proficiency and percentiles for the nation and the states also are presented.

Chapter Two provides results parallel to those in Chapter One for subpopulations of students according to demographic characteristics defined by race/ethnicity, gender, type of community, and parents' education level.

Chapter Three presents the results for the nation, regions, and states for each of the five mathematics content areas defined in the framework, as well as for the special estimation assessment. This special portion of the assessment also has its own achievement levels developed under the direction of NAGB as part of its standard-setting process.

¹⁰Mary Lyn Bourque and Howard H. Garrison, *The Levels of Mathematics Achievement: Initial Performance Standards for the 1990 NAEP Mathematics Assessment* (Washington, D.C.: National Assessment Governing Board, 1991).

¹¹Ina V.S. Mullis, et al., *The State of Mathematics Achievement: NAEP's 1990 Assessment of the Nation and the Trial Assessment of the States* (Washington, D.C.: National Center for Education Statistics, 1991).

¹²Appendix A also briefly describes the process of developing the anchor level descriptions through identifying items that discriminate among students performing at adjacent levels and the close examination by mathematics experts of the characteristics of those items to generalize about the skills exemplified.

¹³Gary W. Phillips, et al., *Interpreting NAEP Scales* (Washington, D.C.: National Center for Education Statistics, 1993).

In addition to Appendix A, which contains the anchor-level data, Appendix B describes the participation rates for the trial state assessments, Appendix C contains additional state-level statistics external to NAEP compiled by NCES, and Appendix D provides further detail about the assessment procedures.

The Mathematics Achievement Levels

As part of the process of setting achievement levels, a broadly constituted panel of judges operationalized the NAGB standards in terms of specific mathematical skills, knowledge, and behaviors that were judged to be appropriate expectations for students in each grade, and were in accordance with the assessment framework for the 1990 and 1992 assessments. The judges rated each item in the 1992 assessment in terms of the expected probability of answering the item correctly at each achievement level, based on the policy definitions and the factors that influence item difficulty. These ratings were aggregated and mapped onto the 0 to 500 NAEP scale to obtain the achievement levels.

Subsequently, the operationalized descriptions were refined by the judges and exemplar questions were selected that reflected the kinds of tasks examinees at or above each level were likely to be able to perform successfully. FIGURES 1.1 through 1.3 show the full text for the descriptions of the three achievement levels developed for each of grades 4, 8, and 12, respectively, and the scale-score cutpoints for each level. Each achievement level at each grade is supported by examples of assessment questions. The exemplars displayed in this report were selected to be illustrative of the content found in the 1992 mathematics assessment framework, and were judged to be generally representative of the achievement levels descriptions. In some cases student performance on these questions meets the standards described in the levels descriptions. In other instances, this is not true, particularly for several exemplars at the advanced level. The national percentages of success presented with the exemplars indicate that students had considerable difficulty with some of the tasks requiring written explanations. Two types of percentages are presented. The overall percent correct shows the national percentage of success on each of the individual questions; that is, the percentage of students across the country who answered the question correctly. The conditional percentage of success on each question for the achievement level shows, of the students who performed in the interval between that achievement level and the next highest achievement level, what percentage of those students

were successful in answering the question. Both these percentages relate to students' performance on the individual assessment questions. The percentages of students at each grade performing at or above the three achievement levels, which differ from the percentages for individual questions, are contained in Table 1.1 following the descriptions and exemplar items.

FIGURE 1.1 Description of Mathematics Achievement Levels for Basic, Proficient, and Advanced Fourth Graders

The five NAEP content areas are (1) numbers and operations, (2) measurement, (3) geometry, (4) data analysis, statistics, and probability, and (5) algebra and functions. At the fourth-grade level, algebra and functions are treated in informal and exploratory ways, often through the study of patterns. Skills are cumulative across levels -- from Basic to Proficient to Advanced.

Basic 211	Fourth-grade students performing at the basic level should show some evidence of understanding the mathematical concepts and procedures in the five NAEP content areas.
------------------	--

Fourth graders performing at the basic level should be able to estimate and use basic facts to perform simple computations with whole numbers; show some understanding of fractions and decimals; and solve some simple real-world problems in all NAEP content areas. Students at this level should be able to use -- though not always accurately -- four function calculators, rulers, and geometric shapes. Their written responses are often minimal and presented without supporting information.

Proficient 248	Fourth-grade students performing at the proficient level should consistently apply integrated procedural knowledge and conceptual understanding to problem solving in the five NAEP content areas.
-----------------------	---

Fourth graders performing at the proficient level should be able to use whole numbers to estimate, compute, and determine whether results are reasonable. They should have a conceptual understanding of fractions and decimals; be able to solve real-world problems in all NAEP content areas; and use four-function calculators, rulers, and geometric shapes appropriately. Students performing at the proficient level should employ problem-solving strategies such as identifying and using appropriate information. Their written solutions should be organized and presented both with supporting information and explanations of how they were achieved.

Advanced 280	Fourth-grade students performing at the advanced level should apply integrated procedural knowledge and conceptual understanding to complex and nonroutine real-world problem solving in the five NAEP content areas.
---------------------	--

Fourth graders performing at the advanced level should be able to solve complex and nonroutine real-world problems in all NAEP content areas. They should display mastery in the use of four-function calculators, rulers, and geometric shapes. These students are expected to draw logical conclusions and justify answers and solution processes by explaining why, as well as how, they were achieved. They should go beyond the obvious in their interpretations and be able to communicate their thoughts clearly and concisely.

Which of the graphs most likely shows the number of pockets that each child had? B

Explain why you chose that graph.

Because it shows 20 students
and most of the students
have pockets.

Explain why you did not choose the other graphs.

It cannot be A because in A
most of the students do not
have pockets.

It cannot be C because in C
there are more than 20
students shown.

Note: Example of an extended response.

*The standard errors of the estimated percentages appear in parentheses.

FIGURE 1.2 **Description of Mathematics Achievement Levels for Basic, Advanced, and Proficient Eighth Graders**

The five NAEP content areas are (1) numbers and operations, (2) measurement, (3) geometry, (4) data analysis, statistics, and probability, and (5) algebra and functions. Skills are cumulative across levels -- from Basic to Proficient to Advanced.

Basic 256	Eighth-grade students performing at the basic level should exhibit evidence of conceptual and procedural understanding in the five NAEP content areas. This level of performance signifies an understanding of arithmetic operations -- including estimation -- on whole numbers, decimals, fractions, and percents.
------------------	---

Eighth graders performing at the basic level should complete problems correctly with the help of structural prompts such as diagrams, charts, and graphs. They should be able to solve problems in all NAEP content areas through the appropriate selection and use of strategies and technological tools -- including calculators, computers, and geometric shapes. Students at this level also should be able to use fundamental algebraic and informal geometric concepts in problem solving.

As they approach the proficient level, students at the basic level should be able to determine which of available data are necessary and sufficient for correct solutions and use them in problem solving. However, these 8th graders show limited skill in communicating mathematically.

Proficient 294	Eighth-grade students performing at the proficient level should apply mathematical concepts and procedures consistently to complex problems in the five NAEP content areas.
-----------------------	--

Eighth graders performing at the proficient level should be able to conjecture, defend their ideas, and give supporting examples. They should understand the connections between fractions, percents, decimals, and other mathematical topics such as algebra and functions. Students at this level are expected to have a thorough understanding of basic level arithmetic operations -- an understanding sufficient for problem solving in practical situations.

Quantity and spatial relationships in problem solving and reasoning should be familiar to them, and they should be able to convey underlying reasoning skills beyond the level of arithmetic. They should be able to compare and contrast mathematical ideas and generate their own examples. These students should make inferences from data and graphs; apply properties of informal geometry; and accurately use the tools of technology. Students at this level should understand the process of gathering and organizing data and be able to calculate, evaluate, and communicate results within the domain of statistics and probability.

Advanced 331	Eighth-grade students performing at the advanced level should be able to reach beyond the recognition, identification, and application of mathematical rules in order to generalize and synthesize concepts and principles in the five NAEP content areas.
---------------------	---

Eighth graders performing at the advanced level should be able to probe examples and counterexamples in order to shape generalizations from which they can develop models. Eighth graders performing at the advanced level should use number sense and geometric awareness to consider the reasonableness of an answer. They are expected to use abstract thinking to create unique problem-solving techniques and explain the reasoning processes underlying their conclusions.

FIGURE 1.3 Description of Mathematics Achievement Levels for Basic, Advanced, and Proficient Twelfth Graders

The five NAEP content areas are (1) numbers and operations, (2) measurement, (3) geometry, (4) data analysis, statistics, and probability, and (5) algebra and functions. Skills are cumulative across levels -- from Basic to Proficient to Advanced.

Basic 287	Twelfth-grade students performing at the basic level should demonstrate procedural and conceptual knowledge in solving problems in the five NAEP content areas.
------------------	--

Twelfth grade students performing at the basic level should be able to use estimation to verify solutions and determine the reasonableness of results as applied to real-world problems. They are expected to use algebraic and geometric reasoning strategies to solve problems. Twelfth graders performing at the basic level should recognize relationships presented in verbal, algebraic, tabular, and graphical forms; and demonstrate knowledge of geometric relationships and corresponding measurement skills.

They should be able to apply statistical reasoning in the organization and display of data and in reading tables and graphs. They also should be able to generalize from patterns and examples in the areas of algebra, geometry, and statistics. At this level, they should use correct mathematical language and symbols to communicate mathematical relationships and reasoning processes; and use calculators appropriately to solve problems.

Proficient 334	Twelfth-grade students performing at the proficient level should consistently integrate mathematical concepts and procedures to the solutions of more complex problems in the five NAEP content areas.
-----------------------	---

Twelfth graders performing at the proficient level should demonstrate an understanding of algebraic, statistical, and geometric and spatial reasoning. They should be able to perform algebraic operations involving polynomials; justify geometric relationships; and judge and defend the reasonableness of answers as applied to real-world situations. These students should be able to analyze and interpret data in tabular and graphical form; understand and use elements of the function concept in symbolic, graphical, and tabular form; and make conjectures, defend ideas, and give supporting examples.

Advanced 366	Twelfth-grade students performing at the advanced level should consistently demonstrate the integration of procedural and conceptual knowledge and the synthesis of ideas in the five NAEP content areas.
---------------------	--

Twelfth-grade students performing at the advanced level should understand the function concept; and be able to compare and apply the numeric, algebraic, and graphical properties of functions. They should apply their knowledge of algebra, geometry, and statistics to solve problems in more advanced areas of continuous and discrete mathematics.

They should be able to formulate generalizations and create models through probing examples and counterexamples. They should be able to communicate their mathematical reasoning through the clear, concise, and correct use of mathematical symbolism and logical thinking.

Overall Average Mathematics Proficiency and Achievement Level Results for the Nation

TABLE 1.1 presents the average mathematics proficiency for fourth-, eighth-, and twelfth-grade students attending public and private schools across the nation. It also shows the percentages of students at each grade performing at or above the three achievement levels. TABLE 1.2 summarizes the scale-score cutpoints corresponding to each achievement level by grade.

TABLE 1.1 National Overall Average Mathematics Proficiency and Achievement Levels, Grades 4, 8, and 12

Grades	Assessment Years	Average Proficiency	Percentage of Students At or Above			Percentage Below Basic
			Advanced	Proficient	Basic	
4	1992	218(0.7)>	2(0.3)	18(1.0)>	61(1.0)>	39(1.0)<
	1990	213(0.9)	1(0.4)	13(1.1)	54(1.4)	46(1.4)
8	1992	268(0.9)>	4(0.4)	25(1.0)>	63(1.1)>	37(1.1)<
	1990	263(1.3)	2(0.4)	20(1.1)	58(1.4)	42(1.4)
12	1992	299(0.9)>	2(0.3)	16(0.9)	64(1.2)>	36(1.2)<
	1990	294(1.1)	2(0.3)	13(1.0)	59(1.5)	41(1.5)

>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level.
 < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level.
 The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

TABLE 1.2 Mathematics Proficiency (Scale-Score Cutpoint) Corresponding to Each Achievement Level, Grades 4, 8, and 12

Grades	Advanced	Proficient	Basic
4	280	248	211
8	331	294	256
12	366	334	287

As expected, the assessment data reveal that students in the higher grades performed better than students in the lower grades. For both 1990 and 1992, the largest gain was from the fourth grade to the eighth grade (50 scale points), although there was also a gain of about 30 scale points from grade 8 to grade 12.

Further, there was a significant improvement in average proficiency at all three grades from 1990 to 1992. This good news may indicate that some of the efforts recommended for teachers and parents by those interested in improving mathematics education are beginning to have some impact on student learning across the country.¹⁴

The bad news is that, even with these gains, more than one-third of the students in grades 4, 8, and 12 performed below the Basic level in the 1992 assessment. Also, considering, for example, that the cutpoint for the Basic level of performance is 211 at grade 4 and that for the Proficient level it is 248, on average, fourth graders are performing only somewhat above the Basic level (218). Similar results were observed for grades 8 and 12, indicating that, on average, students are below the Proficient level and only possess "partial mastery of knowledge and skills that are fundamental for proficient work at each grade."

Fourth Grade: Attainment of Achievement Levels

There were statistically significant increases in the percentages of fourth graders achieving at or above the Basic and Proficient levels from 1990 to 1992. At the fourth grade, in 1992, 61 percent of the students were estimated to be at or above the Basic level of performance in mathematics, with 39 percent estimated to be performing below the Basic level. This implies that at least 61 percent of the students should be able to "use basic facts to perform simple computations with whole numbers; show some understanding of fractions and decimals; and solve simple real-world problems in all the NAEP content areas." Eighteen percent of the students were estimated to be at or above the Proficient level. "These students should have a conceptual understanding of fractions and decimals ...

Everybody Counts: A Report to the Nation on the Future of Mathematic Education, Lynn Steen, editor (Washington, DC: National Research Council, National Academy Press, 1989).

[and] should employ problem-solving strategies such as identifying and using appropriate information. Their written solutions should be organized and presented both with supporting information and explanations of how they were achieved." Only 2 percent of the students were estimated to have reached the Advanced level of achievement. These students "should be able to solve complex and nonroutine real-world problems in all the NAEP content areas."

Eighth Grade: Attainment of Achievement Levels

The percentages of eighth-grade students performing at or above the Basic and Proficient levels increased from 1990 to 1992, although the apparent improvement at the Advanced level was not statistically significant. At the eighth grade, in 1992, 63 percent of the students were estimated to be at or above the Basic level of performance, with 37 percent estimated to be below the Basic level. Students at the Basic level "should exhibit evidence of conceptual and procedural understanding in the five NAEP content areas. This level of performance signifies an understanding of arithmetic -- including estimation -- on whole numbers, decimals, fractions, and percents." Twenty-five percent of the students were estimated to have reached the Proficient level of solid academic performance. These students "should apply mathematical concepts and procedures consistently to complex problems in the five NAEP content areas." Four percent of the eighth graders were estimated to have reached the Advanced level of superior performance in which the students "should be able to reach beyond the recognition, identification, and application of mathematical rules in order to generalize and synthesize concepts and principles in the five NAEP content areas."

Twelfth Grade: Attainment of Achievement Levels

Twelfth-grade students showed significant gains at the Basic level from 1990 to 1992. However, there were no statistically significant improvements in the percentages of students achieving at or above the Proficient or Advanced levels. At the twelfth grade, 64 percent of the students were estimated to be at or above the Basic level, with an estimated 36 percent falling below that level. Twelfth-grade students falling within the Basic range of the NAEP mathematics assessment "should demonstrate procedural and conceptual knowledge in solving problems in the five NAEP content areas." Sixteen percent of the students were

estimated to have achieved the Proficient level of solid academic performance. Students at the Proficient level "should consistently integrate mathematical concepts and procedures to the solutions of more complex problems in the five NAEP content areas." Only 2 percent of the high-school seniors were estimated to have demonstrated the superior performance of the Advanced level, at which students "should consistently demonstrate the integration of procedural and conceptual knowledge and the synthesis of ideas in the five NAEP content areas."

For grades 4, 8, and 12, the percentages of students estimated to have met or exceeded the Proficient level were 18, 25, and 16 percent, respectively. The Proficient level is the level at which students "demonstrate competency over challenging subject matter and are well prepared for the next level of schooling." There are potentially many explanations for one-fourth or fewer of the students at any of the grades assessed reaching the Proficient level of achievement. One possibility is that students are simply not learning very much mathematics in school. This is consistent with such national reports as *A Nation at Risk*,¹⁵ which warned of the mediocrity of our educational system. A second possible explanation is that students have not had the opportunity to learn the knowledge and skills covered in the NAEP assessment. If the content on the assessment is not generally taught in the U.S. curriculum, then students cannot be expected to perform well on the assessment. This may be especially true with the 1992 NAEP survey because it was focused on the curriculum and evaluation standards recommended by the NCTM. There is evidence from NCTM studies and NAEP indicating that the *NCTM Standards* have not been widely implemented in the nation's schools.¹⁶ A third explanation for the students' poor performance may be that the achievement levels are simply very high. The achievement levels were set by NAGB using a broadly representative consensus process. There may be a large discrepancy between the high expectations of what students should know and be able to do compared to what they actually do know and are able to do.

Overall Mathematics Proficiency by Region

The regional results for nationally representative samples of students attending private as well as public schools are presented in TABLE 1.3. At all three grades assessed, in 1992, students in the Northeast, Central, and West had higher average proficiency than those in the Southeast. The national increase at grade 4 in overall average mathematics proficiency was reflected in each region except the West. At grade 8, there were gains in the Central and West, and at grade 12 students in the Southeast showed improvement in average proficiency.

Only one to five percent of the students across the regions in any of the three grades assessed were estimated to have attained the Advanced level, and this reflected essentially no change between 1990 and 1992.

At grade 4, the estimated percentages of students performing at or above the Proficient level were Northeast -- 24 percent, Central -- 21 percent, West -- 17 percent, and Southeast -- 12 percent. This represented a significant gain for the Central region between 1990 and 1992. Approximately two-thirds of the fourth graders in the Northeast and Central regions, 60 percent in the West, and 50 percent in the Southeast were estimated to have performed at the Basic level or beyond. Significantly fewer fourth graders in the Southeast than in other regions reached the Basic level, with one-half of the students classified as below Basic. Between 1990 and 1992, there were no statistically significant changes in the percentages of fourth graders performing at or above the Basic level for any of the four regions.

At grade 8, the only significant increase from 1990 to 1992 in percentages of students reaching any of the achievement levels was shown at the Proficient level in the Central region. In 1992, 30 percent of the eighth graders were estimated to have performed at or above the Proficient level in the Central region, 27 percent at or above the proficient level in the Northeast, 25 percent in the West, and 19 percent in the Southeast. Seventy-one percent of the eighth graders in the Central region, 62 to 63 percent in the Northeast and West, and 55 percent in the Southeast were estimated to have reached the Basic level (or better).

The results differed at grade 12, with students in the Southeast showing gains at the Proficient level. However, the estimated 11 percent performing at or above this level still lagged significantly behind the 18 to 19 percent classified as Proficient or above in the Northeastern and Central regions. Approximately 15 percent of the twelfth graders in the West achieved at or above the Proficient level. At grade 12, students performing at or above the Basic level included an estimated 70 percent in the Central region, 67 percent in the Northeast, 64 percent in the West, and 55 percent in the Southeast. Compared to about one-third of the students in other regions, 45 percent of the students in the Southeast were classified as below Basic.

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). Percentages may not total 100 percent due to rounding error.

Overall Mathematics Achievement for the States

As shown in TABLE 1.4, the results for the states tend to parallel the findings for the four regions reported by NAEP according to the regional location of the state.¹⁷ It should be noted that for comparisons between the nation or the regions and the participating states, the national and regional data provided in TABLE 1.4 should be used. Because the national assessment included both public- and private-school students, in contrast to the state assessments, which only included students attending public schools, the national and regional results provided together with the state data are based only on students attending public schools. For this reason, the national and regional data in TABLE 1.4 may be slightly different from those presented previously in this chapter.

For most jurisdictions participating in NAEP's Trial State Assessment Program, the majority of the fourth graders performed at or above the Basic level. However, it is estimated that the achievement of more than half of the fourth graders was below the Basic level in Alabama, Arkansas, California, the District of Columbia, Louisiana, Mississippi, South Carolina, Tennessee, and Guam. More than one-fourth of the students in grade 4 were estimated to be at or above the Proficient level in Iowa, Maine, Minnesota, and New Hampshire. Very few fourth graders in any state -- approximately 0 to 4 percent -- attained the level indicating Advanced performance.

At grade 8, the results were similar, with the largest proportion of students performing at or above the Basic level, but relatively smaller percentages of them performing at or above the Proficient level. The jurisdictions with more than half of their eighth graders estimated to be below the Basic level were Alabama, the District of Columbia, Louisiana, Mississippi, Guam, and the Virgin Islands. Across jurisdictions, from 1 to 37 percent of the eighth graders performed at or above the Proficient level. Still, the percentages of students estimated to be at or above the Advanced level remained quite small, from 0 to 6 percent.

¹⁷Appendix D provides information about the assignment of states to the four regions -- Northeast, Southeast, Central, and West. It should be noted that the regional results shown in the state tables are based on the nationally and regionally representative samples of public-school students who were assessed as part of the national program, and not from an aggregate of the separate state-by-state samples. Using the regional results from the national program is necessary because the voluntary nature of the Trial State Program did not guarantee representative regional results from the aggregated data across states, since not all states in all regions participated.

Minnesota	227 (0.9)	3 (0.5)	27 (1.2)	72 (1.4)	28 (1.4)
Mississippi	200 (1.1)	0 (0.1)	7 (0.7)	37 (1.3)	63 (1.3)
Missouri	221 (1.2)	2 (0.3)	19 (1.3)	64 (1.6)	36 (1.6)
Nebraska	224 (1.3)	3 (0.5)	23 (1.7)	68 (1.8)	32 (1.8)
New Hampshire	229 (1.2)	3 (0.6)	26 (1.7)	74 (1.6)	26 (1.6)
New Jersey	226 (1.5)	3 (0.7)	25 (1.6)	70 (2.1)	30 (2.1)
New Mexico	212 (1.5)	1 (0.4)	11 (1.3)	52 (1.9)	48 (1.9)
New York	217 (1.3)	2 (0.3)	17 (1.3)	59 (1.9)	41 (1.9)
North Carolina	211 (1.1)	2 (0.4)	13 (0.9)	52 (1.6)	48 (1.6)
North Dakota	228 (0.8)	2 (0.3)	23 (1.1)	74 (1.2)	26 (1.2)
Ohio	217 (1.2)	2 (0.3)	17 (1.1)	59 (1.7)	41 (1.7)
Oklahoma	219 (1.0)	1 (0.4)	14 (1.1)	62 (1.6)	38 (1.6)
Pennsylvania	223 (1.4)	3 (0.5)	23 (1.5)	66 (1.9)	34 (1.9)
Rhode Island	214 (1.6)	2 (0.4)	14 (1.2)	56 (2.2)	44 (2.2)
South Carolina	211 (1.1)	1 (0.3)	13 (1.1)	49 (1.5)	51 (1.5)
Tennessee	209 (1.4)	1 (0.2)	10 (1.0)	49 (2.1)	51 (2.1)
Texas	217 (1.3)	2 (0.5)	16 (1.3)	58 (1.7)	42 (1.7)
Utah	223 (1.0)	2 (0.3)	20 (1.1)	67 (1.6)	33 (1.6)
Virginia	220 (1.3)	3 (0.7)	19 (1.6)	60 (1.4)	40 (1.4)
West Virginia	214 (1.1)	1 (0.3)	13 (1.0)	54 (1.6)	46 (1.6)
Wisconsin	228 (1.1)	3 (0.5)	25 (1.4)	72 (1.3)	28 (1.3)
Wyoming	224 (1.0)	2 (0.3)	19 (1.2)	70 (1.4)	30 (1.4)
TERRITORY					
Guam	191 (0.8)	0 (0.1)	5 (0.5)	28 (1.2)	72 (1.2)

The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated. (xxx) Did not participate in the 1990 Trial State Assessment.

Trends in State Performance at Grade 8

As depicted in TABLE 1.4, of the 37 jurisdictions participating in both the 1992 and 1990 Trial State Assessment Programs in eighth-grade mathematics, five had significantly higher average proficiency in 1992 -- Hawaii, Minnesota, New Hampshire, North Carolina, and Rhode Island. This is in the context of stringent statistical criteria taking into account the numerous possible comparisons across all 37 jurisdictions, the four regions of the country, and the nation (as contained in TABLE 1.3 and designated by the symbol >>).¹⁸

In considering results for individual states, significant improvements also were found in Arizona, Colorado, Connecticut, the District of Columbia, Idaho, Iowa, Kentucky, New Mexico, Oklahoma, Texas, Wyoming, Guam, and the Virgin Islands (designated by the symbol >). Taken together, significant improvement was noted for 18 of the 37 participants.

The graphic display of these changes presented in FIGURE 1.4 indicates gains for some jurisdictions in all regions of the country. However, there seems to be a particular concentration of contiguous states showing improvement in what might be considered the Southwest/West/Rocky Mountain region -- Idaho, Wyoming, Colorado, Arizona, New Mexico, Texas, and Oklahoma.

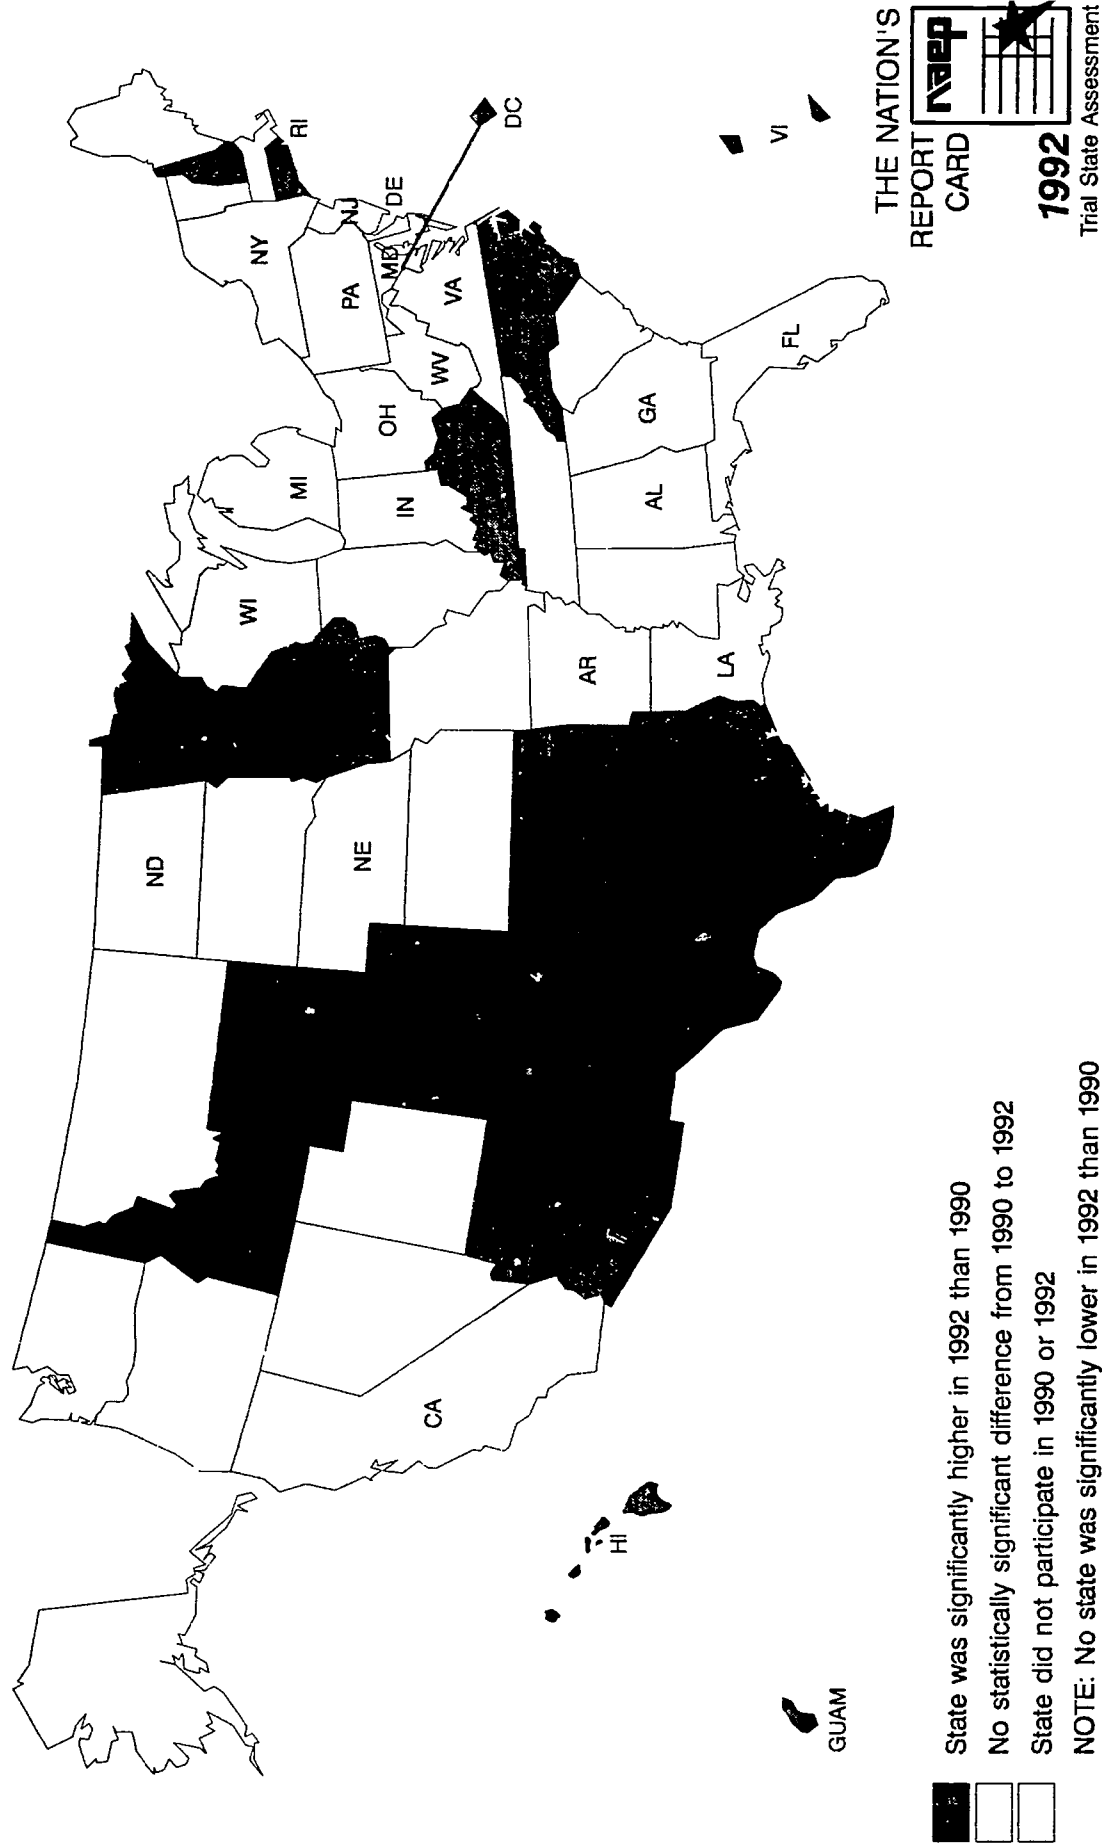

For Arizona, the District of Columbia, Hawaii, Kentucky, and Rhode Island, the significant improvements in overall mathematics proficiency resulted from higher proportions of students achieving the Basic level than did in 1990. In Colorado, Iowa, New Hampshire, North Carolina, and Texas, there were gains at both the Basic and Proficient levels. In Minnesota, there was improvement at all three achievement levels.

¹⁸Stringent criteria are used in comparing results across jurisdictions because of the extremely large number of comparisons involved. So many possible comparisons increases the likelihood of seeming to find differences when none exist. In considering results for a single state, fewer comparisons are involved and less stringent criteria can be used for determining statistically significant differences. (Please see Appendix D for further details.)

The NAEP Trial State Assessment

Comparisons of Overall Mathematics Proficiency at Grade 8

1992 vs. 1990

Comparisons Among States Based on Average Proficiency

FIGURES 1.5 and 1.6 are provided to help interpret differences in the average proficiencies across states for grades 4 and 8 in 1992. These figures provide a method for making appropriate comparisons in average overall mathematics proficiency across the states, territories, and the District of Columbia. The figures show whether or not the differences in average performance between pairs of states are statistically significant.¹⁹

For example, in FIGURE 1.5, although the average proficiencies in the fourth-grade appear to be different between Maine (231) and Nebraska (224), they in fact are **not** statistically different. It needs to be understood, however, that the computations underlying FIGURES 1.5 and 1.6 take the confidence intervals or degree of sampling error associated with the estimates of average proficiency into account, as well as the estimates of average proficiency themselves. Interestingly, then, the difference in average proficiency between Maine (231) and Wyoming (224) is statistically significant, even though Nebraska and Wyoming had the same average proficiency. The confidence interval for Nebraska was larger than that of Wyoming, and Nebraska's confidence interval overlapped with Maine's whereas Wyoming's did not.

As an example of how to read FIGURES 1.5 and 1.6, let us say we are attempting to compare the state of Texas to all other states, territories, and the District of Columbia. Reading vertically down the FIGURE 1.5 column labeled Texas, we see that, on average, students in Texas scored lower than did students in all the states listed from Maine through Wyoming (the dark grey shaded states), about the same, on average, as students in the states listed from Pennsylvania through Tennessee (the white shaded states), and better, on average, than students in all the states from Arkansas to Guam (the light grey shaded states).

From FIGURES 1.5 and 1.6 we see that in 1992 the cluster of highest performing states for the fourth-grade assessment consisted of Maine, Iowa, New Hampshire, Wisconsin, North Dakota, Minnesota, New Jersey, Connecticut, Massachusetts, and Nebraska. For the eighth grade, the highest performing states were Iowa, North Dakota, Minnesota, Maine, New Hampshire, Wisconsin, and Nebraska.

¹⁹The significance tests in FIGURES 1.5 and 1.6 are based on a Bonferroni procedure for multiple comparisons that holds to 5 percent across all possible comparisons the probability of erroneously declaring the means of any two states to be different when they are not.

For the eighth grade, the cluster of lowest performing states consisted of Alabama, Louisiana, and Mississippi. At the fourth grade, Alabama, Louisiana, Mississippi, and California were the lowest performing states. At both the fourth and eighth grades, Guam and the District of Columbia scored significantly lower than all the states, as did the Virgin Islands at grade 8.

FIGURE 1.5

Comparisons of Overall Mathematics Average Proficiency 1992 Grade 4

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- No statistically significant difference from the state listed at the top of the chart.
- State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Comparisons of Overall Mathematics Average Proficiency 1992 Grade 8

INSTRUCTIONS:

Read **down** the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Percentiles of Overall Mathematics Achievement for the Nation and the States

The national percentiles of the distributions of overall mathematics proficiency shown in TABLE 1.5 illustrate the extent of variation within each of the three grades assessed. For example, the range between the 5th and 95th percentiles of performance within each grade exceeded the range across the grades at any one percentile.

TABLE 1.5 Percentiles of Overall Mathematics Proficiency, Grades 4, 8, and 12

Grades	Assessment Years	5th Percentile	10th Percentile	25th Percentile	50th Percentile	75th Percentile	90th Percentile	95th Percentile
4	1992	162(1.1)	175(0.9)	197(1.0)>	220(1.0)>	241(1.2)>	259(0.8)>	269(1.5)
	1990	159(1.9)	171(1.6)	193(1.0)	214(1.1)	235(1.1)	253(1.5)	264(1.7)
8	1992	206(1.9)	220(0.9)	242(1.3)	268(1.4)	294(0.9)>	315(1.0)>	326(1.8)>
	1990	201(2.3)	215(2.2)	239(1.8)	264(1.2)	288(1.1)	307(1.9)	319(1.6)
12	1992	240(1.9)>	253(1.2)>	275(1.4)	300(1.2)	323(1.3)	343(1.0)	354(1.3)
	1990	233(1.6)	247(1.0)	270(1.3)	296(1.5)	319(1.4)	339(1.6)	350(3.1)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent confidence that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

The changes between 1990 and 1992 show that not only did students at all three grades improve on average, but they also had significant increases at various percentiles across the range of achievement. At grade 4, increases were noted through most of the upper 75 percent of the distribution (25th, 50th, 75th, and 90th percentiles). At grade 8, gains were found for the top 25 percent of the distribution -- 75th, 90th, and 95th percentiles. At grade 12, the improvement was found in the lower end of the distribution at the 5th and 10th percentiles.

The improvements between assessments are encouraging. However, placing the percentile results in the context of the achievement levels set by the Board indicates that performance would need to improve substantially to meet those expectations. The differences between the 10th percentiles and the cutpoints for the Basic level are similar in magnitude to the difference in average proficiency between grade 8 and grade 12 (about 30 scale points). This magnitude is the same for the differences between the 50th percentiles and the lower boundaries of the Proficient level. Large gains would be required before half the students at each grade attained the Proficient level, which indicates competency over challenging subject matter.

The percentile distributions in TABLE 1.6 illustrate the extent of variation in assessment results at the state level at grades 4 and 8. At grade 8, the data are presented for both 1992 and 1990. The same information is portrayed graphically in FIGURES 1.7 through 1.9. There were considerable differences in achievement between the higher- and lower-performing states. For example, performance at the 90th percentile in some states and territories was comparable to performance at the 75th percentile in other states. The variation within states, however, tended to exceed the variation in average performance across states.

Several states showed excellent progress in improving achievement at grade 8 across the range of the distribution, especially Minnesota and North Carolina. Hawaii showed significant gains in the lower portion of the distribution, as did Rhode Island.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

The *darker shaded* boxes indicate the ranges between the 25th and 75th percentiles of the mathematics proficiency distribution, and the *lighter shaded* boxes the ranges between the 5th to 25th percentiles and the 75th to 95th percentiles of the distribution.

Summary

There was a significant improvement in average mathematics proficiency at all three grades between 1990 and 1992. However, even with these gains students' performance fell considerably short of the guidelines set by the Board for where they should be performing. According to procedures which involved broadly constituted panels of judges setting three achievement levels -- Basic, Proficient, and Advanced -- it was estimated that only small percentages of students (2 to 4 percent) attained their grade's designated Advanced level, which signifies superior performance.

Proficient, the central level, represents solid academic performance and competence with challenging subject matter. Eighteen percent of the students at grade 4, 25 percent at grade 8, and 16 percent at grade 12 were estimated to be at or above the Proficient level. The Basic level denotes partial mastery of the knowledge and skills fundamental for proficient work at each grade. About 60 percent of the students at each grade were estimated to be at or above this performance level, which conversely meant that from 36 to 39 percent of the students were estimated to have performed below the Basic level. There were significant increases from 1990 to 1992 at each grade in the percentages of students performing at or above the Basic level. At grades 4 and 8, there also were increases in the percentages of students performing at or above the Proficient level. The percentages of students attaining the Advanced level remained essentially constant between the two assessments.

The results by percentile indicated upward movement for the upper 75 percent of the fourth graders, the top 25 percent of the eighth graders, and the lower 10 percent of the twelfth graders.

Across the regions of the country, signs of improvement were noted in all four regions of the country -- Northeast, Southeast, Central, and West -- for all three grades (except for grade 8 in the Northeast). Not all of these apparent gains were statistically significant, however. Fourth graders had significantly higher average proficiency in 1992 than in 1990 in all regions of the country except the West. Statistically significant improvements were noted in the Central and West at grade 8, and in the Southeast at grade 12. The pattern of pervasive improvements left the relative standing of the regions about the same from assessment to assessment. The Southeast continues to trail the other three regions at all three grades.

As would be anticipated, the state-by-state results mirrored the national and regional results. Across the states the majority of the fourth and eighth graders tended to perform at or above the Basic level. In general, fewer than one-fourth of the students at grade 4 and fewer than one-third of the students at grade 8 were estimated to be at or above the Proficient performance level. From 0 to 6 percent were estimated to have attained the Advanced level at either grade.

Among the 37 jurisdictions that participated in both the 1990 and 1992 Trial State Assessments at grade 8, significant improvements in average mathematics proficiency were noted in 18 -- Arizona, Colorado, Connecticut, the District of Columbia, Hawaii, Idaho, Iowa, Kentucky, Minnesota, New Hampshire, New Mexico, North Carolina, Oklahoma, Rhode Island, Texas, Wyoming, Guam, and the Virgin Islands. Thus, there were increases for about half of the participants. These improvements were scattered across the country and in the territories, although a number seemed to be concentrated in the Southwest/West/Rocky Mountain portion of the country.

In 1992, at grade 4, based on statistical tests of multiple comparisons, the highest performing states included Maine, Iowa, New Hampshire, Wisconsin, North Dakota, Minnesota, New Jersey, Connecticut, Massachusetts, and Nebraska (see FIGURE 1.5). At grade 8, the highest performing states were Iowa, North Dakota, Minnesota, Maine, New Hampshire, Wisconsin, and Nebraska (see FIGURE 1.6). Lower-performing jurisdictions at both grades included Alabama, Louisiana, Mississippi, the District of Columbia, and Guam; the Virgin Islands was also among the lower-performing jurisdictions at grade 8.

CHAPTER TWO

Overall Mathematics Achievement for Demographic Groups for the Nation and the States

National Performance by Race/Ethnicity

Average mathematics performance and the percentages of students at or above the three achievement levels for students in five racial/ethnic groups in grades 4, 8, and 12 for 1990 and 1992 are presented in TABLE 2.1. For both assessments and at all three grades, the overall pattern of average proficiency is the same: Asian/Pacific Islander and White students had higher average proficiency in mathematics than Black students, and Hispanic and American Indian students performed somewhere in between.²⁰

Average performance in mathematics increased significantly between 1990 and 1992 for White students at all three grades, and for Black and Hispanic students at grade 12. The only significant gains at specific achievement levels were found for fourth- and eighth-grade White students at the Basic and Proficient Levels.

Relatively few students in any racial/ethnic group at any grade achieved the Advanced level in either 1990 or 1992. Among Asian/Pacific Islander students in 1992, 5 percent were estimated to have reached this level at grade 4, 14 percent at grade 8, and 6 percent at grade 12. From 2 to 4 percent of the White students were estimated to have attained the Advanced level at all three grades.

²⁰Countless studies have found differences in mathematics achievement to be systematically related to socioeconomic background. The confounding between socioeconomic background factors and the race/ethnicity findings is further described in conjunction with Table 2.17 showing the percentages of students attending the top- and bottom-performing schools by demographic subgroup.

For American Indian, Black, and Hispanic students, from 0 to 2 percent across the three grades assessed were estimated to have reached the Advanced level.

In 1992, it is estimated that from 30 to 44 percent of the Asian/Pacific Islander students and from 19 to 32 percent of the White students performed at or above the Proficient level. Ten percent or fewer of the American Indian, Black, or Hispanic students were estimated to be at or above the Proficient level.

	1990	3(0.3)	311(5.2)	5(2.6)	25(6.2)	76(5.0)	24(5.0)
American Indian	1992	1(0.1)	281(9.0)	0(0.3)	4(2.7)	46(16.3)	54(16.3)
	1990	1(0.3)	288(10.2)!	0(0.0)	4(6.8)	62(15.9)	38(15.9)

>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent. Percentages may not total 100 percent due to rounding error.

Approximately three-fourths of the Asian/Pacific Islander (76 to 81 percent) and White (72 to 74 percent) students demonstrated mathematics achievement at or above the Basic level, while fewer than one-half of their American Indian, Hispanic, and Black classmates did. Approximately three-fourths of Black students at grades 4 and 8, and two-thirds at grade 12, were classified as performing below the Basic level.

Performance by Race/Ethnicity for the States

TABLE 2.2 presents the data for average mathematics proficiency for the various racial/ethnic groups for fourth graders in 1992 and eighth graders in 1992 and 1990 for the states and territories that participated in the Trial State Assessment Program. In most jurisdictions, the pattern observed in the national data was also found in the states for both fourth and eighth grades. In a number of jurisdictions, however, there were no significant differences in average mathematics performance between Hispanic and Black students.

TERRITORY										
Guam	12 (0.7)	205 (2.0)	4 (0.4)	183 (5.4)	20 (0.8)	179 (2.1)	62 (1.0)	193 (1.2)	2 (0.4)	*** (***)

The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. The percentages for race ethnicity may not add to 100 percent because some students categorized themselves as "other." ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

Eighth-grade White students' average mathematics proficiency increased from 1990 to 1992 in Connecticut, Delaware, Florida, Idaho, Iowa, Michigan, Minnesota, New Hampshire, New York, North Carolina, Ohio, Rhode Island, and Texas. Black students' performance improved from 1990 to 1992 in Rhode Island and Texas and for Hispanic students, improvements were made in Colorado, North Carolina, and Pennsylvania. Performance for Asian/Pacific Islander students improved in Hawaii and gains by American Indian students were made in Arizona, New Mexico, and North Dakota.

The state-by-state percentages of fourth and eighth graders performing at or above the three achievement levels and below the Basic level for the five racial/ethnic groups in 1992 and 1990 are displayed in TABLE 2.3.

At grade 4, across participating jurisdictions, from 1 to 5 percent of the White students were estimated to be at the Advanced level, with the exception of the District of Columbia. Although the White fourth graders comprised a small percentage of the population in the District of Columbia (5 percent), 14 percent were estimated to have reached the Advanced Level. Only Minnesota and Guam had as many as 1 percent of their Black students estimated to be at or above the Advanced level. Connecticut, Florida, Maine, Massachusetts, Michigan, Missouri, Nebraska, New Hampshire, New Jersey, Pennsylvania and Wisconsin each had about 1 percent of their Hispanic students reaching the Advanced level. Ten percent of the Asian/Pacific Islander students in New York were estimated to be at or above the Advanced level. In Maryland, Massachusetts, New Jersey, Texas, and Virginia, about 6 to 7 percent of the Asian/Pacific Islander students reached this level, as did approximately 4 percent in California, 2 percent in Hawaii, and 1 percent in Colorado. Small percentages (about 1 to 2 percent) of the American Indian fourth graders reached the Advanced level in California, Colorado, Ohio, and Wyoming.

TERRITORY										
Guam	1 (0.8)	1 (0.8)	0 (0.3)	0 (0.2)	*** (***)	11 (1.9)	3 (2.9)	2 (0.8)	5 (0.7)	*** (***)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

In general, across participating jurisdictions, about 13 to 33 percent of the White fourth graders were estimated to be at or above the Proficient level. The District of Columbia was the exception, with approximately one-half (52 percent) of its small percentage of White students reaching this level. Across all jurisdictions, it was estimated that the achievement of 5 percent or fewer Black students and 15 percent or fewer Hispanic students reached the Proficient level. The percentages of Asian/Pacific Islander students reaching this level were estimated to be between 16 and 40 percent in California, Colorado, Hawaii, Maryland, Massachusetts, New Jersey, New York, Texas, and Virginia. Rhode Island and Guam had 1 and 5 percent, respectively, of their Asian/Pacific Islander students attaining the Proficient level. For American Indian students in those states with large enough samples to report results, from 3 to 12 percent were estimated to have reached the Proficient level.

It is estimated that New Jersey was the only participating jurisdiction to have fewer than one-fifth (17 percent) of the White fourth graders perform below the Basic level. Alabama, Arkansas, Kentucky, Louisiana, Mississippi, Tennessee, West Virginia, and Guam had approximately 40 percent or more of their White fourth graders performing below the Basic level. For Black fourth graders, from about three-fifths to more than four-fifths were below the Basic level in all jurisdictions. For most jurisdictions, the percentages of Hispanic students estimated to be below the Basic level of performance ranged from more than one-third to almost four-fifths. The pattern for Asian/Pacific Islander students was mixed, with two states, Virginia (16 percent) and New Jersey (17 percent), estimated to have relatively low percentages of fourth graders performing below the Basic level. However, in other jurisdictions, including Guam (71 percent) and Rhode Island (74 percent), very high proportions of Asian/Pacific Islander students were estimated to have performed below the Basic level. In general, except for Arizona with an estimated high of 73 percent, about one-half of the American Indian fourth graders performed below the Basic level.

In 1992, it was estimated that 6 percent or fewer of the White eighth graders across all 44 participating jurisdictions were at or above the Advanced level. Only in Massachusetts were as many as 1 percent of the Black eighth graders estimated to be at the Advanced level. Approximately 1 to 2 percent of the Hispanic eighth graders in Arkansas, Hawaii, Indiana, Iowa, Maryland, Michigan, Missouri, New Hampshire, New Jersey, New York, Oklahoma, Texas, Utah, Virginia, and Wyoming reached this highest level. It was estimated that from 1 percent in Rhode Island to 24 percent in Texas of the Asian/Pacific

Islander eighth graders attained the Advanced level as did about 1 percent of the American Indian students in Maine and Oklahoma.

In 1992, the percentages of White eighth graders estimated to be at or above the Proficient level ranged from a low of 13 percent in West Virginia to a high of 39 percent in Minnesota and Iowa. Approximately 10 percent or fewer Black students and 15 percent or fewer Hispanic students performed this well. Except for Hawaii and Rhode Island (both 18 percent) and Guam (7 percent), from about one-third to two-thirds of the Asian/Pacific Islander students achieved the Proficient level or beyond. Sixteen percent or fewer of the American Indian students in any jurisdiction were estimated to have reached this level.

From approximately one-fifth to more than one-third of the White students did not reach the Basic level. In Alabama, Louisiana, Mississippi, and West Virginia, more than 40 percent of the White students were estimated to have performed below the Basic level. Across participating jurisdictions, from about three-fifths to more than four-fifths of the Black eighth graders did not reach the Basic level. For Hispanic eighth graders, the proportion of students estimated to be below Basic in 1992 ranged from about one-half to more than four-fifths. Approximately one-third to two-thirds of the Asian/Pacific Islander eighth graders in Hawaii, Rhode Island and Guam performed below the Basic level. In general, from more than one-third to almost two-thirds of the American Indian students were estimated to perform below the Basic level.

There were no significant changes in the percentages of eighth graders reaching the Advanced level for any racial/ethnic group between 1990 and 1992 in any jurisdiction. Between 1990 and 1992, the percentages of White students in grade 8 reaching the Proficient level increased significantly in Connecticut, Florida, Iowa, Maryland, Minnesota, New Hampshire, and Ohio. There were no significant changes for other racial/ethnic groups at this achievement level. The percentage of White students below Basic decreased significantly in Connecticut, Florida, Iowa, Kentucky, New Hampshire, and Rhode Island. Decreases in the group performing below Basic were also found among Black students in the District of Columbia, Hispanic students in Guam, Asian/Pacific Islander students in Hawaii, and American Indian students in Arizona.

National Performance by Gender

The national data for average mathematics proficiency and achievement levels for male and female students in grades 4, 8, and 12 for 1990 and 1992 are presented in TABLE 2.4. In 1992, male students had higher average proficiency than female students at grade 12, but there was no significant difference at grades 4 and 8. Between 1990 and 1992, there was a significant increase in the mathematics performance of both male and female students at all three grades.

TABLE 2.4 Average Mathematics Proficiency and Achievement Levels by Gender, Grades 4, 8, and 12

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

In 1992, 4 percent or fewer of either male or female students were estimated to have reached the Advanced achievement level in all three grades. Although the percentages are small (3 percent compared to 1 percent), significantly more males than females reached the Advanced level in twelfth grade.

About the same percentages of males and females were estimated to have reached the Proficient level at grades 4 and 8 -- about one-fifth and one-fourth, respectively. At grade 12, however, significantly more males than females reached this level (18 percent compared to 14 percent). Essentially the same proportion of males and females (60 percent or so) reached the Basic level at all three grades.

Between 1992 and 1990, fourth-grade males showed gains at both the Proficient and Basic levels. Increased percentages of females were estimated to have performed at or above the Basic level at grade 4, and at or above both the Proficient and Advanced levels at grade 8.

National Performance by Race/Ethnicity and Gender

TABLE 2.5 presents national average mathematics proficiency and achievement levels by race/ethnicity and gender for grades 4, 8, and 12 for 1992 and 1990. The general pattern at all three grades is one in which White male and female students have higher average proficiencies than do their Hispanic and Black counterparts.

Hispanic male and female students had higher average proficiencies in mathematics than did Black male and female students in grades 4 and 8. At twelfth grade, there was no significant difference between the performance of Hispanic and Black male students, but Hispanic female students performed better, on average, than did Black female students. Also, White males had higher average proficiency than did White females. Gains in average performance were made by White male and female students at all three grades and by Black and Hispanic female students in twelfth grade.

In 1992, it is estimated that very few students in any category at any grade reached the Advanced level -- 4 percent or fewer White male and female students, virtually no Black male or female students or Hispanic male students, and only 1 percent of the Hispanic female students at eighth and twelfth grades. Significantly more White male students than female students were estimated to have reached the Proficient level at grade 12 (22 percent compared to 16 percent).

An estimated 9 percent or fewer of the Black and Hispanic male and female students achieved at or above the Proficient level at any grade.

In 1992, 70 percent or more of the White male and female students at all three grades were estimated to be above the Basic level of performance. For Black male and female students, about one-fourth of those in fourth and eighth grade and about one-third of those in twelfth grade were at or above the Basic level. More than one-third to almost one-half of the Hispanic male and female students achieved at or above this level.

TABLE 2.5 Average Mathematics Proficiency and Achievement Levels by Race/Ethnicity and Gender, Grades 4, 8, and 12

	Assessment Years	Percentage of Students	Average Proficiency	Percentage of Students At or Above			Percentage Below Basic

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for detail). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

Gains in the percentages reaching the Advanced level between 1990 and 1992 were evident only among White eighth-grade female students, and the difference was not statistically significant. At the Proficient level, gains were made by White males at grades 4 and 8 and White females at the eighth grade; the apparent gain by Black males at grade 4 was not statistically significant. For those performing at or above the Basic level, gains were made by White male and female students at both grades 4 and 8 and by Hispanic females at grade 12.

Performance by Gender for the States

TABLE 2.6 displays the average mathematics proficiency for male and female fourth- and eighth-grade students in 1992 and eighth-grade students in 1990 for those states and territories that participated in the Trial State Assessments. In 1992, in most states and territories the average performance for males and females was about the same.

Gains in average mathematics proficiency between 1990 and 1992 were made by male eighth graders in Colorado, Hawaii, Idaho, Minnesota, New Hampshire, North Carolina, Rhode Island, and Texas. Eighth-grade female students made gains in Arizona, California, Colorado, Florida, Hawaii, Iowa, Kentucky, Minnesota, New Mexico, North Carolina, Oklahoma, Rhode Island, Texas, Wyoming, Guam, and the Virgin Islands.

The achievement levels by gender for the states participating in the Trial State Assessment Program in 1990 and 1992 are presented in TABLE 2.7. In 1992, in most states and territories, males and females reached the three achievement levels in about the same proportions at both grades 4 and 8.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated. (xxx) Did not participate in the 1990 Trial State Assessment.

Guam	0 (0.2)	1 (0.2)	4 (0.7)	5 (0.8)	25 (2.1)	31 (1.3)	75 (2.1)	69 (1.3)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One.

(xxx) Did not participate in the 1990 Trial State Assessment.

Between 1990 and 1992 for eighth graders, the only significant increase in percentages of students reaching the Advanced level was for female students in Minnesota. Larger proportions of male students performed at or above the Proficient level in 1992 than in 1990 in Minnesota, New Hampshire, North Carolina, and Texas. Gains in the percentages of female students reaching the Proficient level were found in Florida, Iowa, Minnesota, New York, and Ohio. At the Basic level, male eighth-grade students made gains in Hawaii and North Carolina, as did female students in Arizona, Iowa, North Carolina, and Rhode Island.

National Performance by Type of Community

Average mathematics proficiency and achievement levels for the nation by type of community for grades 4, 8, and 12 for 1992 and 1990 are shown in TABLE 2.8. Students were classified by the type of community in which their schools were located and by principals' reports of the percentages of students in their schools whose parents were classified into various occupational categories. The disadvantaged urban category represents about 10 percent of the students at each grade attending schools in suburban and urban communities where students' parents had professional or managerial jobs. Similarly, the disadvantaged urban category represents another 10 percent of the students, who attended schools in suburban and urban locales where high proportions of the parents were on welfare or not regularly employed. The extreme rural category includes the approximately 10 percent of students attending schools in the most rural areas, where many of the parents were farmers or farm workers. The 70 percent of students not falling into one of these three "extreme" community categories were classified as attending schools in "other" types of communities.

TABLE 2.8 Average Mathematics Proficiency and Achievement Levels by Type of Community, Grades 4, 8, and 12

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent. Percentages may not total 100 percent due to rounding error.

At all three grades, the advantaged urban students performed better than the students in the extreme rural category, who, in turn, performed better than those students attending schools in disadvantaged urban areas. In the fourth and eighth grades, the students in extreme rural schools had about the same average proficiency as students in the "other" category, but at grade 12 students in the "other" category had higher average proficiency than those in the extreme rural areas.

Reflecting the overall national gains in performance from 1990 to 1992, students attending schools in "other" types of communities showed gains at all three grades. In contrast, there were few significant changes in performance for students attending schools in the extreme types of communities. The one exception was a decline in the average mathematics proficiency of eighth-grade students attending schools in disadvantaged urban areas. Because this decline was unusual in the context of the generally positive trends between 1990 and 1992, and because it occurred for students who may be considered more at risk than their counterparts, some additional analyses were conducted.

As explained above, the approach in defining the community types is to classify approximately the most extreme 10 percent of the advantaged urban, disadvantaged urban, and rural schools according to economic indicators as defined by parents' occupation. Because the percentages are kept essentially constant from assessment year to assessment year, the classification criteria can change. Thus, to provide additional perspective for the results for disadvantaged urban students, the results were also analyzed using the 1990 cutoff criteria. These results, presented in the Procedural Appendix under the discussion of the NAEP reporting groups, indicate that using the 1990 criteria, the percentage of students classified as disadvantaged urban would have been 14 percent rather than 9 percent at grade 8, but on the whole their proficiency would have been comparable across assessments -- 248 in 1992 and 249 in 1990. This additional perspective also shows that in 1992 the most extreme of these students were more disadvantaged according to the NAEP criteria as well as having lower average proficiency.

Across the three grades, between 6 to 10 percent of the advantaged urban students were estimated to have attained the Advanced level. In comparison, virtually no disadvantaged urban students at grades 4 and 12, and only about 1 percent at grade 8 reached that level. For extreme rural students, approximately 1 percent in the fourth grade and 2 percent at the eighth grade were at the Advanced level. From about one-third to almost one-half of the advantaged urban students were at or above the Proficient level in all three grades. For

disadvantaged urban students, only 3 percent of the fourth graders and 6 percent of the eighth and twelfth graders were estimated to be at this same level. From about 10 percent (grade 12) to 21 percent (grade 8) of the extreme rural students were classified as Proficient. More than 80 percent of the advantaged urban students were estimated to be at or above the Basic level at all three grades.

Considering the results by type of community, no statistically significant gains were made between 1990 and 1992 in the percentages of students reaching the Advanced level. Gains at the Proficient level were made by advantaged urban students in grade 8 and by students in other communities at grades 4 and 8. Students in other communities also made gains at or above the Basic level at grade 4. In contrast, there was a significant decline (42 percent to 28 percent) in the eighth-grade disadvantaged urban students reaching this level.

Performance by Type of Community for the States

TABLE 2.9 displays average mathematics proficiency by type of community for grade 4 in 1992 and for grade 8 in 1990 and 1992 for those states and territories that participated in the Trial State Assessment Program.

The pattern at grades 4 and 8 in 1992 mirrors the pattern for the nation, with advantaged urban students performing best, followed by those in extreme rural and disadvantaged urban schools. In many instances, however, the apparent differences were not statistically significant, particularly between the rural and either the advantaged or disadvantaged urban student population. The advantaged urban students tended, however, to have higher average mathematics proficiency than did their less advantaged counterparts.

There were some changes between 1990 and 1992 at grade 8. Hawaii experienced a decline in the average proficiency of students in advantaged urban areas, while this same group experienced an increase in Kentucky, New Hampshire, New York, Ohio, Rhode Island, and Texas. Oklahoma showed an increase in the average proficiency of students attending schools in disadvantaged urban communities, while Idaho, Iowa, Kentucky, Louisiana, and Ohio saw an increase in the proficiency of their extreme rural students. In Guam, there was a decline in average mathematics proficiency for eighth graders in extreme rural communities.

TABLE 2.10 contains the achievement level results by type of community for states and territories participating in the Trial State Assessments in 1990 and 1992 in fourth- and eighth-grade mathematics.

At grade 4, all states and territories with advantaged urban students had at least a small percentage (1 to 10) of those students estimated to be at or above the Advanced level. Few fourth graders attending schools in disadvantaged urban or extreme rural communities were estimated to have reached the Advanced level -- from 0 to 4 percent.

All jurisdictions, except the District of Columbia, had more than 20 percent of their advantaged urban fourth graders estimated to be at or above the Proficient level. In contrast, no jurisdiction had more than 17 percent of its disadvantaged urban fourth graders estimated to be at or above the Proficient level. Approximately one-fourth of the extreme rural fourth graders in several states, including Iowa, Maine, Minnesota, New Hampshire, Pennsylvania, Wisconsin, and Wyoming, were estimated to have reached the Proficient level, with the percentages becoming smaller for other participating jurisdictions. In the District of Columbia, about half the advantaged urban fourth-grade students were estimated to be below the Basic level as were 43 percent in Delaware, which contrasts with 30 percent or fewer for other jurisdictions. In nearly all participating states and territories, it is estimated that 40 percent or more of the disadvantaged urban fourth graders achieved below the Basic level, including 80 percent or more in the District of Columbia and Louisiana. For the majority of participating states, fewer than half of the fourth graders attending school in extreme rural areas were estimated to have performed below the Basic level.

At the eighth grade in 1992, all states with enough advantaged urban students for reporting purposes had at least a small percentage -- from about 1 to 14 percent -- of those students at or above the Advanced level. In contrast, from 0 to 4 percent of the disadvantaged urban eighth graders were estimated to have reached this level, as were from 0 to 5 percent of those in extreme rural schools. Between 1990 and 1992, there were few changes by type of community in the percentages of eighth graders reaching the Advanced level.

Three jurisdictions, Alabama, the District of Columbia, and Hawaii, had fewer than 20 percent of their advantaged urban eighth graders estimated to be achieving at or above the Proficient level. On the other hand, only four states, Idaho, Iowa, Utah, and Wyoming, had more than 20 percent of their disadvantaged urban students estimated to be at or above the same achievement level. It was estimated that for the extreme rural students at eighth grade, about half of the states had more than 20 percent at or above the Proficient level and about half had fewer than 20 percent at or above that level. Improvements at the Proficient level were noted for advantaged urban students in New Hampshire, Ohio, and Texas as well as for extreme rural students in Iowa. Declines were

noted for advantaged urban students in Hawaii and extreme rural students in Guam.

Two states, Massachusetts and New Hampshire, were estimated to have fewer than 10 percent of their advantaged urban eighth graders below the Basic level, and two jurisdictions, the District of Columbia and Hawaii, had more than 50 percent of the same group estimated to be below Basic. For most states, more than one-half of the disadvantaged urban eighth graders performed below the Basic level. Also, in most states, fewer than half of the extreme rural students performed below the Basic level. Exceptions included Alabama, Arizona, Georgia, Louisiana, Mississippi, North Carolina, West Virginia, Guam, and the Virgin Islands, where an estimated 50 percent or more of the eighth graders did not reach the Basic level. More eighth graders attained the Basic level or beyond in 1992 than in 1990, including advantaged urban students in New Hampshire and Texas, disadvantaged urban students in Oklahoma, and extreme rural students in Iowa, Kentucky, and Louisiana. However, similar to the Proficient level, decreases at the Basic level were noted for advantaged urban eighth graders in Hawaii and extreme rural eighth graders in Guam.

The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

Guam	*** (***)	*** (***)	0 (0.4)	0 (0.2)	*** (***)	*** (***)	2 (0.7)	6 (0.7)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

Average Overall Mathematics Proficiency by Quintiles for Selected Demographic Groups

FIGURE 2.1 presents the average mathematics proficiency for the states and territories that participated in the 1992 Trial State Assessment by 20 percent bands, called quintiles, for selected demographic subgroups. For example, those states in the highest, or fifth, quintile of performance, had average proficiency in the top 20 percent of the states for the demographic characteristic under consideration. The quintiles of performance, in descending order, show the highest to lowest performing states according to the following 20 percent intervals: 1) 80 to 100; 2) 60 to 80; 3) 40 to 60; 4) 20 to 40; and 5) 0 to 20 percent.

This information can be used to summarize performance across states for the race/ethnicity, gender, and community type data presented in earlier sections of this chapter as well as the results by level of parents' education in the following section.

Across states, performance by gender appeared essentially equivalent. That is, states whose male students had average proficiency in the top 20 percent across participating jurisdictions also had female students who tended to outperform their counterparts. There were, however, some exceptions. In Michigan, New York, and West Virginia, the fourth-grade males were in a higher quintile than the females, while for Arizona, Georgia, and Missouri the reverse happened. Across participating jurisdictions at grade 8, males were in a higher quintile than females in Michigan, Tennessee, Texas, and Utah, whereas females were in the higher quintile in Delaware, Hawaii, Virginia, and Wyoming.

Average proficiency by quintile tended to vary somewhat more for the other three demographic groups shown. For example, at grade 4 in Indiana, White students were in the second to lowest quintile, Black students in the middle quintile, and Hispanic students in the second to highest quintile. At grade 8 in Colorado, the disadvantaged urban students performed in the top 20 percent of disadvantaged urban students across participating jurisdictions, the extreme rural students were in the second highest quintile, and the advantaged urban students in the middle quintile.

States categorized in the bottom 20 percent of performance have average mathematics proficiencies in the lowest fifth of the average mathematics proficiency distribution of all states and are indicated by the number 1 (first quintile). States with average proficiencies in the top 20 percent of the distribution are indicated by the number 5 (fifth quintile). The numbers 2, 3, and 4 indicate states with average proficiencies in the second, third, and fourth fifths of the distribution.

X Sample size too small (fewer than 62 students) to permit reliable reporting of performance bands (quintiles).

States categorized in the bottom 20 percent of performance have average mathematics proficiencies in the lowest fifth of the average mathematics proficiency distribution of all states and are indicated by the number 1 (first quintile). States with average proficiencies in the top 20 percent of the distribution are indicated by the number 5 (fifth quintile). The numbers 2, 3, and 4 indicate states with average proficiencies in the second, third, and fourth fifths of the distribution.

X Sample size too small (fewer than 62 students) to permit reliable reporting of performance bands (quintiles).

National Performance by Parents' Highest Level of Education

TABLE 2.11 contains the national data for average mathematics proficiency and achievement levels by parents' highest level of education for students in grades 4, 8, and 12 in 1990 and 1992. In 1992, eighth- and twelfth-grade students whose parents had graduated from college performed better on average in mathematics than those students whose parents had some education after high school. This latter group of students performed significantly better than those whose parents had graduated from high school, and this group in turn performed better than those students whose parents did not finish high school. At grade 4, the pattern was similar, except that there was no significant difference between students whose parents had graduated from college and those whose parents had some education after high school. However, it should be noted that in both 1990 and 1992 a much higher percentage of students at grade 4 than at grades 8 and 12 were unsure about their parents' education level. Approximately one-third of the fourth graders did not know the answer to this question compared to about 9 percent of the eighth graders and 2 to 3 percent of the twelfth graders.

Average performance in mathematics improved from 1990 to 1992 at all three grades for students who reported their parents had graduated from college. At grade 4, students whose parents had graduated from high school showed improvement. At grades 8 and 12, there also were gains for those students whose parents had not finished high school.

In 1992, it was estimated that virtually no fourth or twelfth graders whose parents had only a high school diploma or less reached the Advanced achievement level, and at eighth grade only 1 percent were at the Advanced level for the corresponding groups of students. Six percent or fewer of the students whose parents either had some education past high school or had graduated from college were estimated to be at or above the Advanced level at any grade. Thirteen percent or fewer of the students whose parents had only a high school diploma or less were estimated to have performed at or above the Proficient level at any of the three grades assessed. For those students whose parents had some education after high school, about one-fifth in fourth grade, almost one-fourth in eighth grade, and 13 percent in twelfth grade were estimated to be at or above the Proficient level. For students whose parents had graduated from college, about one-fourth in fourth grade, more than one-third in eighth grade, and one-fourth in twelfth grade were estimated to be at or above the Proficient level. About 40 percent of the students at all three grades whose parents did not finish high school and about one-half of the students at all three grades whose parents

had graduated from high school were estimated to be achieving at or above the Basic level. Approximately two-thirds of the students whose parents had some education after high school were estimated to be at or above this level at all three grades. Also, about the same proportion of fourth graders whose parents graduated from college reached the Basic level or higher. About three-fourths of the eighth and twelfth graders who had parents who were college graduates achieved at or above the Basic level.

Although the percentages of students attaining the Advanced level remained essentially unchanged between 1990 and 1992, gains at the Proficient level were made during the same period by eighth graders whose parents had graduated from college. Gains at the Proficient and Basic levels were made by fourth graders who were unsure about their parents' educational background.

TABLE 2.11 Average Mathematics Proficiency and Achievement Levels by Parents' Highest Level of Education, Grades 4, 8, and 12

	Assessment Years	Percentage of Students	Average Proficiency	Percentage of Students At or Above			Percentage Below Basic

	1990	8(0.7)	272(2.1)	0(0.0)	3(1.9)	30(3.5)	70(3.5)
I don't know	1992	3(0.3)	276(3.0)	0(0.8)	3(1.9)	37(5.6)	63(5.6)
	1990	2(0.3)	268(4.9)	0(1.1)	3(1.8)	32(6.5)	68(6.5)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent. Percentages may not total 100 percent due to rounding error.

Performance by Parents' Highest Level of Education for the States

Average mathematics proficiency by parents' highest level of education for states and territories is displayed in TABLE 2.12. The overall pattern for fourth and eighth graders shows that average performance of students whose parents graduated from college is higher than or the same as the average performance of students whose parents have some education after high school. In addition, students whose parents have some education after high school show an average performance level equal to or higher than the average performance of students whose parents graduated from high school. The average performance level of students whose parents graduated from high school is the same as or higher than that for students whose parents did not finish high school. It should be remembered, however, that approximately one-third of the fourth graders did not know their parents' educational level.

Trends between 1990 and 1992 for eighth graders show increased average mathematics proficiency for students in Connecticut, Iowa, Kentucky, Minnesota, North Carolina, and Texas whose parents had graduated from college; for students in North Carolina whose parents had some education after high school; and for students in Colorado, Idaho, Minnesota, and New Hampshire whose parents had graduated from high school.

TABLE 2.13 shows the achievement levels of fourth and eighth graders by their parents' educational background. The overall pattern among fourth and eighth graders is that higher percentages of students whose parents graduated from college performed at or above the Advanced and Proficient levels than did students whose parents are less well educated, particularly those whose parents had not graduated from high school.

Three states had significant increases between 1990 and 1992 in the percentages of students reaching the Proficient achievement level for students whose parents had graduated from college -- Iowa, Kentucky, and Minnesota. In Kentucky, there also was an increase in the percentage of students that reached the Basic level for those whose parents had graduated from college. Across the participating jurisdictions, however, statistically significant performance improvements were not found at the achievement levels for eighth graders whose parents had not graduated from college.

The percentages for parents' highest level of education may not add to 100 percent because some students responded "I don't know." »The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. «The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

TABLE 2.12 | Average Mathematics Proficiency by Parents' Highest Level of Education (continued)

PUBLIC SCHOOLS	Grade 8 - 1990									
	Graduated College		Some Education After High School		Graduated High School		Did Not Finish High School		I Don't Know	
	Percentage of Students	Average Proficiency	Percentage of Students	Average Proficiency	Percentage of Students	Average Proficiency	Percentage of Students	Average Proficiency	Percentage of Students	Average Proficiency

The percentages for parents' highest level of education may not add to 100 percent because some students responded "I don't know." (xxx) Did not participate in the 1990 Trial State Assessment.

Guam	0 (0.4)	3 (1.5)	0 (0.4)	0 (0.0)	0 (0.2)	5 (1.0)	14 (3.1)	3 (1.2)	3 (2.4)	5 (0.8)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students.

Guam	29 (2.1)	49 (5.0)	22 (3.0)	20 (5.0)	28 (2.0)	71 (2.1)	51 (5.0)	78 (3.0)	80 (5.0)	72 (2.0)

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One.

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One. >The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One.

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One. (xxx) Did not participate in the 1990 Trial State Assessment.

National Performance by Public and Private Schools

Average mathematics proficiency and achievement levels for the nation by type of school for students in grades 4, 8, and 12 in 1990 and 1992 are presented in TABLE 2.14. Students going to private schools were divided into two categories: those attending Catholic schools and those attending other types of private schools. At all three grades, students in private schools, either Catholic or other, have higher average mathematics proficiency than do students attending public schools.

Between 1990 and 1992, average performance increased for fourth graders attending either public or Catholic schools, and for eighth graders attending public schools. At grades 8 and 12, gains were found for students attending non-Catholic private schools, although the estimates were less stable.

It is estimated that approximately 2 to 8 percent of the students across the three grades assessed reached the Advanced achievement level in 1992, for the three types of schools. Approximately one-fifth of fourth graders in all three types of schools performed at or above the Proficient level. At grades 8 and 12, a greater percentage of private-school students than public-school students performed at or above the Proficient level. Twenty-three percent of the public-school eighth graders were estimated to have reached the Proficient level compared to about 32 percent in Catholic schools and 43 percent in other private schools. At grade 12, 14 percent of the public-school students were estimated to be at or above the Proficient level compared to 22 percent of the Catholic-school students and 36 percent of those attending other private schools. More private-school than public-school students also reached the Basic level at all three grades assessed. Approximately three-fifths of the public-school students at all three grades were estimated to have achieved at or above the Basic level compared to approximately 70 percent of the fourth graders, three-fourths of the eighth graders, and about 80 percent of the twelfth graders attending private schools (both Catholic and other).

Compared to 1990, the percentage of students reaching the Advanced level in 1992 increased for eighth graders attending other private schools. Gains at the Proficient level were made by public-school fourth graders, eighth graders attending all three types of schools, and twelfth graders attending other private schools. At the Basic level, fourth-grade public-school students and twelfth graders attending non-Catholic private schools showed improvement from 1990 to 1992.

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). Percentages may not total 100 percent due to rounding error.

National Performance at Grade 12 by High-School Program After High School

As shown in TABLE 2.15, high-school seniors who reported being enrolled in academic programs had higher average mathematics proficiency than their classmates enrolled in general or vocational/technical programs. Between 1990 and 1992, the average proficiency of twelfth graders increased for all three types of high-school programs. Consistent with the findings for type of high-school program, seniors planning to attend a four-year college had higher average mathematics proficiency than did those with other plans after graduation.

TABLE 2.15 Average Mathematics Proficiency by Type of High-School Program and Plans After High-School Graduation, Grade 12

Type of High-School Program	Assessment Years	Percent of Students	Average Proficiency
Academic	1992	61(1.5)	315(0.8)>

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). Percentages may not total 100 percent due to rounding error.

National Performance by Average School Performance

To examine the relationship between level of school performance and level of student performance, NAEP sorted schools by their students' average performance on the mathematics assessments, identifying the top one-third and bottom one-third of the schools. The average mathematics proficiency and achievement levels for the top one-third of the schools and the bottom one-third of the schools in grades 4, 8, and 12 in 1992 and 1990 are presented in TABLE 2.16.

TABLE 2.16 Average Mathematics Proficiency and Achievement Levels for the Top One-Third of the Schools and the Bottom One-Third of the Schools, Grades 4, 8, and 12

				Percentage of Students At or Above			
	Assessment Years	Percentage of Students	Average Proficiency	Advanced	Proficient	Basic	Percentage Below Basic

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent confidence for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

By definition, the average mathematics proficiency of the top-performing schools is higher than that of the bottom-performing schools, but it is interesting to look at changes within the groups at each grade between 1990 and 1992. At all three grades, there was an increase in average mathematics proficiency in the top one-third of the schools over the two-year period. In contrast, for students attending schools in the bottom one-third of mathematics performance, only twelfth graders showed gains.

In 1992, only a handful of students in the bottom one-third of the nation's schools in any of the three grades assessed were estimated to have reached the Advanced level. In comparison, an estimated 4 to 8 percent of the students in the top one-third of the schools, depending on the grade, attained this achievement level. From six to almost nine times as many students in the top one-third of schools reached the Proficient level as did students in the bottom one-third of the schools, again depending on the grade level. More than twice as many students in the top one-third of the schools as in the bottom one-third of the schools were estimated to have reached the Basic level across the three grades.

Some gains in the percentages of students at the various achievement levels between 1990 and 1992 were found for students in the top one-third of the schools. For example, at the fourth and eighth grades, increases were noted at the Proficient and Basic levels, and at the twelfth grade gains were made at the Basic level of achievement. In contrast, no statistically significant improvements were observed at any grade for any achievement level for students in the bottom one-third of the schools.

TABLE 2.17 presents data about the percentages of students from demographic subgroups in the higher- and lower-performing schools. Approximately one-third to almost one-half of the White and Asian/Pacific Islander students in all three grades attended schools in the top one-third of mathematics performance, as was the case for Northeast and Central students. Also, approximately 40 percent of the students whose parents had graduated from college attended higher-performing schools, as did about three-fifths to four-fifths of the students from advantaged urban communities.

TABLE 2.17 Percentage of Students Within Selected Demographic Subgroups in the Top One-third of the Schools and the Bottom One-Third of the Schools, Grades 4, 8, and 12

In contrast, about two-thirds of the Black students and more than half of the Hispanic students at all three grades attended lower-performing schools, as did about 70 percent or more of the students attending schools in disadvantaged urban communities. The large proportion of students in disadvantaged urban communities attending lower-performing schools and the disproportionate percentages of Black and Hispanic students attending these schools coincide with other studies on the effect of poverty on learning and reinforce the effect of socioeconomic status on the findings by race/ethnicity.²¹

Performance by Average School Performance for the States

The achievement levels for states and territories for the top one-third of the schools in grade 4 in 1992 and in grade 8 in 1990 and 1992 are presented in TABLE 2.18, and those for the bottom one-third of the schools are presented in TABLE 2.19. At grade 4, all states and jurisdictions had some students in the top-third schools reaching the Advanced level. It was estimated that Connecticut, New Jersey, and Virginia had as high as 7 percent of their fourth graders in top-third schools at this level. Most jurisdictions had from 20 to around 40 percent of their fourth graders in the top-third schools estimated to be at or above the Proficient level; the several exceptions with fewer students were Arkansas (17 percent), the District of Columbia (16 percent), Louisiana (16 percent), Mississippi (14 percent), and Guam (8 percent). The participating states and territories were estimated to have from 65 to 89 percent of their fourth graders in the top-third schools achieving at or above the Basic level, with the exception of the District of Columbia (47 percent), Mississippi (59 percent), and Guam (38 percent).

Fourth graders attending schools classified in the bottom one-third of proficiency did not often perform at the Advanced level. There were seven states where about 1 to 2 percent of the fourth graders in lower-performing schools were estimated to have attained the Advanced level: Delaware, Iowa, Maine, Minnesota, North Dakota, Wisconsin, and Wyoming. Except for Maine (17 percent) and Minnesota (16 percent), most jurisdictions had 15 percent or fewer of fourth graders in bottom-third schools estimated to be at or above the Proficient level. For many participating states and territories fewer than half of the fourth graders in bottom-third schools were estimated to be at or above the Basic level.

At grade 8, all jurisdictions had from 1 to 9 percent of the students in the top-third schools estimated to be at or above the Advanced level, except the Virgin Islands. Iowa, Minnesota, and New Jersey were the three states where 9 percent of their eighth graders in the top-third schools were estimated to have attained the highest achievement level. In most jurisdictions, it was estimated that from 20 to 50 percent of the eighth graders in top-third schools achieved at or above the Proficient level in mathematics. The exceptions to this pattern were for the top-third schools in the District of Columbia, Mississippi, Guam, and the Virgin Islands, where fewer than one-fifth of the students were estimated to have reached the Proficient level. Only the District of Columbia, Hawaii, Mississippi, Guam, and the Virgin Islands had fewer than between 65 and 90 percent of eighth graders in top-third schools estimated to be at or above the Basic level of performance.

It was estimated that slightly more than half of the participating states and territories had from 1 to 3 percent of their eighth graders in bottom-third schools reach the Advanced level. Across all jurisdictions, one-fourth or fewer of eighth graders in bottom-third schools were estimated to be at or above the Proficient level. For most participating states and territories, between about one-third and two-thirds of eighth graders in bottom-third schools were estimated to have performed at or above the Basic level. However, lower percentages were estimated for Alabama, California, the District of Columbia, Louisiana, Mississippi, Guam, and the Virgin Islands.

Between 1990 and 1992, average mathematics proficiency among eighth graders in top-third schools increased in Arizona, California, Colorado, Connecticut, Florida, Hawaii, Idaho, Kentucky, Louisiana, Minnesota, New Jersey, New York, North Carolina, Ohio, and Texas. Only the top-third schools in Texas showed an increased percentage of eighth graders at the Advanced level between 1990 and 1992. Eighth graders from top-third schools in California, Minnesota, New York, and Texas showed increased percentages in 1992 over 1990 at the Proficient level. Percentages of eighth graders in top-third schools at or above the Basic level increased between 1990 and 1992 in Colorado, New York, and North Carolina.

Average mathematics proficiency among eighth graders in bottom-third schools increased in Arizona, Colorado, Delaware, Hawaii, Idaho, Iowa, Minnesota, Nebraska, New Hampshire, New Mexico, North Carolina, North Dakota, Oklahoma, Texas, Virginia, West Virginia, and the Virgin Islands. Although no participating jurisdiction showed significant increase in the percentage of eighth graders in bottom-third schools at or above the Advanced level between 1990 and 1992 three states showed increases at the Proficient level--Hawaii, Iowa, and Minnesota. Increased percentages of eighth graders in bottom-third schools performed at or above the Basic level in Hawaii, Kentucky, New Hampshire, North Carolina, Texas, and the Virgin Islands.

TABLE 2.20 presents the percentages of students within selected demographic subgroups in the top-performing one-third of the schools in grades 4 and 8 for each of the states and territories participating in the Trial State Assessments in 1990 and 1992. TABLE 2.21 presents percentages of students in the same demographic groups for the bottom-performing one-third of the schools. If students in the various demographic subgroups were distributed evenly among the top-performing one-third of schools as well as the middle-third and bottom-third of schools, one would expect about 33 percent of each demographic subgroup in each category of schools. If there are more than 33 percent of the

students in any one demographic subgroup in one or another of the school-performance clusters, then the group could be thought of as overrepresented in that cluster. Likewise, if there are fewer than 33 percent of students in a demographic group in a school-performance cluster, then that group could be thought of as underrepresented.

In general at grade 4, Black students appear to be underrepresented in top-performing schools, except in Kentucky, New Mexico, West Virginia, and Guam. Hispanic students also seem to be underrepresented in these schools, except in Iowa, Louisiana, Missouri, North Carolina, North Dakota, Oklahoma, Virginia, and West Virginia. In contrast, Asian/Pacific Islander students are overrepresented in the top one-third of schools, except in Hawaii, Massachusetts, New York, Rhode Island, and Guam.

The pattern is much the same at grade 8. Black students are underrepresented in top-performing schools, as are Hispanic students, except in Delaware, the District of Columbia, and Virginia. Conversely, Asian/Pacific Islander students tend to be overrepresented, except in Rhode Island and Guam.

In all participating jurisdictions at both grades, students attending disadvantaged urban schools were underrepresented in the top-performing one-third of the schools, as were students whose parents were less well educated. There was no significant difference in any jurisdiction between the percentages of males and females in the top one-third of schools.

As might be anticipated, the pattern of percentages by the various demographic subgroups in the bottom-performing one-third of the schools in grades 4 and 8 was the reverse of the pattern in the top one-third schools. At the fourth grade, Black students are overrepresented in the bottom-third schools, except in Hawaii, New Mexico, and Guam; the same overrepresentation holds true for Hispanic students, except in Alabama, Kentucky, Louisiana, South Carolina, and West Virginia. Also, Asian/Pacific Islander fourth graders were underrepresented in the bottom-third schools, with the exception of Hawaii, Massachusetts, Rhode Island, and Guam. At grade 8, the several exceptions to the pattern of overrepresentation of Black and Hispanic students and the underrepresentation of Asian/Pacific Islander students in lower-performing schools included the District of Columbia, Hawaii, New York, Rhode Island, and Guam.

At both grades 4 and 8, there were high percentages of disadvantaged urban students in the lower-performing one-third of schools, and students whose parents did not finish high school or graduated from high school also were overrepresented. However, both males and females in each jurisdiction seemed to be equally represented in the bottom-third of schools.

TERRITORY						
Guam	33 (0.1)	202 (1.5)	1 (0.3)	8 (1.3)	38 (2.6)	62 (2.6)

The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. ¹ Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

Guam	37 (0.2)	180 (1.5)	0 (0.2)	3 (0.5)	18 (1.7)	82 (1.7)

The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. ¹ Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. ***The number of schools or students was considered insufficient for this analysis. Underlying subgroup population proportions provided in previous tables should be considered in interpreting these results. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

Guam	24 (2.7)	33 (5.6) [!]	45 (2.1)	37 (0.8)	*** (***)	*** (***)	*** (***)	80 (0.3)	19 (0.3)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. ***The number of schools or students was considered insufficient for this analysis. Underlying subgroup population proportions provided in previous tables should be considered in interpreting these results. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

Summary

The NAEP results for demographic subpopulations indicate enormous diversity in mathematics performance across the nation and in the jurisdictions participating in the Trial State Assessments. The performance gaps were substantial between higher- and lower-performing groups, with the former including Asian/Pacific Islander and White students, those attending schools in advantaged urban areas, those whose parents had education beyond high school, and those with expectations to attend college. The lower-performing groups included American Indian, Black, and Hispanic students, those attending schools in disadvantaged urban areas, and those whose parents had a high-school education or less. Further, the higher-performing groups of students appeared to be more highly concentrated in particular schools, as were the lower-performing groups of students. That is, Asian/Pacific Islander students, students whose parents had graduated from high school, and students attending schools in advantaged urban communities were overrepresented in top-performing schools, whereas Black and Hispanic students, students whose parents had not graduated from high school, and students attending disadvantaged urban schools were overrepresented in bottom-performing schools.

Between 1990 and 1992, there were increases in national performance for various demographic groups, which generally were mirrored in the participating states and territories. However, these increases tended to occur more frequently for the higher-performing than lower-performing populations. For example, national performance in mathematics increased for White students at all three grades, but increases for Black and Hispanic students took place only at grade 12. In 1992, it was estimated that from 72 to 81 percent of the Asian/Pacific Islander and White students demonstrated mathematics achievement at or above the Basic level, while fewer than one-half of the American Indian, Black, and Hispanic students did.

The average mathematics proficiency of both males and females increased at all three grade levels between 1990 and 1992. However, males seem to still maintain a slight advantage at grade 12. Greater percentages of male than female twelfth graders reached the Proficient and Advanced achievement levels.

A gain at the Proficient level was made by eighth graders attending advantaged urban schools, however, their counterparts attending schools in disadvantaged urban communities experienced a decline in overall mathematics achievement. At grades 4 and 12, there were essentially no changes in

performance for urban students in either advantaged or disadvantaged communities between 1990 and 1992.

At all three grades, average mathematics proficiency improved between 1990 and 1992 for students whose parents had graduated from college. The other groups classified by parents' education level showing increases were fourth graders whose parents had graduated from high school but had no further education, and students at grades 8 and 12 whose parents had not finished high school.

In 1992 at all three grades, students attending private schools (either Catholic or non-Catholic) had higher average mathematics proficiency than did students attending public schools. Students attending public schools showed increased mathematics proficiency between 1990 and 1992 at grades 4 and 8. Fourth graders attending Catholic schools also showed gains, as did eighth and twelfth graders attending other private schools (although the results for other private schools were less stable).

As might be anticipated because of the clustering of top-performing students in the better-performing schools, higher percentages of students in these schools reached each of the three achievement levels than did students in the lower-performing schools. In the top-performing one-third of the schools, for example, the estimated percentages of students reaching the Proficient level were 34, 45, and 29 percent, respectively, at grades 4, 8, and 12. The comparable percentages for students in the lower-performing one-third of schools were estimated to be 4, 8, and 5 percent, respectively. Additionally, gains in mathematics proficiency between 1990 and 1992 were noted for students in the top one-third of the schools. Average performance increased at all three grade levels, as did the percentage of students reaching the Basic level. Improvements also were noted at the Proficient level at grades 4 and 8. In contrast, even though students at grade 12 attending the lower-performing one-third of the schools showed an increase in average mathematics proficiency, significant improvements did not occur for students attending these schools at grades 4 and 8, and no significant improvements were found at any of the three achievement levels across the three grades assessed.

CHAPTER THREE

Mathematics Achievement by Content Areas for the Nation and the States

Chapters One and Two described the overall mathematics performance of students at grades 4, 8, and 12 and of specific demographic subgroups for the national and state samples. In this chapter, we examine students' performance as it relates to their mathematics proficiency in the various content areas within mathematics.²² The five content areas are numbers and operations; measurement; geometry; data analysis, statistics, and probability; and algebra and functions. Data for a sixth area, estimation, were derived from student responses to a particular set of items administered at grades 4, 8, and 12 using a special paced-audiotape procedure that attempted to move students at a rate unreasonably fast for calculating answers, thus supporting the procedure of estimation. A brief description of each of the six areas within mathematics is given in FIGURE 3.1.

²²Further information is provided in Appendix D. For a full description of the framework underlying NAEP's 1990 and 1992 mathematics assessments, see *Mathematics Objectives, 1990 Assessment*.

Background and Description of the Mathematics Content Areas

FIGURE 3.1
Description of Content Areas

Numbers and Operations

This content area focuses on students' understanding of numbers (whole numbers, fractions, decimals, and integers) and their application to real-world situations, as well as computational and estimation situations. Understanding numerical relationships as expressed in ratios, proportions, and percents is emphasized. Students' skills in estimation, mental computation, use of calculators, generalization of numerical patterns, and verification of results are also included.

Measurement

This content area focuses on students' ability to describe real-world objects using numbers. Students are asked to identify attributes, select appropriate units, apply measurement concepts, and communicate measurement-related ideas to others. Questions are included that require an ability to read instruments using metric, customary, or nonstandard units with emphasis on precision and accuracy. Questions requiring estimation; measurements; and applications of measurements of length, time, money, temperature, mass/weight, area, volume capacity, and angles are also included under this content area.

Geometry

This content area focuses on students' knowledge of geometric figures and relationships and on their skills in working with this knowledge. These skills are important at all levels of schooling as well as in practical applications. Students need to be able to model and visualize geometric figures in one, two, and three dimensions and to communicate geometric ideas. In addition, students should be able to use informal reasoning to establish geometric relationships.

Data Analysis, Statistics, and Probability

This content area focuses on data representation and analysis across all disciplines and reflects the importance and prevalence of these activities in our society. Statistical knowledge and the ability to interpret data are necessary skills in the contemporary world. Questions emphasize appropriate methods for gathering data, the visual exploration of data, and the development and evaluation of arguments based on data analysis.

Algebra and Functions

This content area is broad in scope, covering a significant portion of the grade 9-12 curriculum, including algebra, elementary functions (pre-calculus), trigonometry, and some topics in discrete mathematics. For the fourth grade, and in part, at grade 8, algebraic and functional concepts are treated in more informal, exploratory ways. Proficiency in this content area requires both manipulative facility and conceptual understanding; it involves the ability to use algebra as a means of representation and to use algebraic skills and concepts as problem-solving tools. Functions are viewed not only in terms of algebraic formulas, but also in terms of verbal descriptions, tables of values, and graphs.

Estimation

Estimation involving whole numbers, fractions and decimals pervades most of the content areas in mathematics. Presented using a paced-audiotape procedure, questions assess students' abilities to make estimates appropriate to a wide variety of situations. Estimates take into consideration such factors as knowing when to estimate and whether to overestimate or underestimate in a particular problem.

* * *

A second feature of the design in the construction of the items was the anticipated cognitive ability required of the student to correctly respond to the item. These three categories, conceptual understanding, procedural knowledge, and problem solving, are detailed in FIGURE 3.2. The main intent in the use of these categories is to provide balance within each content area among items requiring the use of conceptual knowledge and those requiring procedural skill. The ability category of problem solving requires students to integrate their knowledge of both of the prior areas with their knowledge of problem-solving in the solution of new situations.

FIGURE 3.2

Description of Mathematical Abilities

The following three categories of mathematical abilities are not to be construed as hierarchical. For example, problem solving involves interactions between conceptual knowledge and procedural skills, but what is considered complex problem solving at one grade level may be considered conceptual understanding or procedural knowledge at another.

Conceptual Understanding

Students demonstrate conceptual understanding in mathematics when they provide evidence that they can recognize, label, and generate examples and counterexamples of concepts; can use and interrelate models, diagrams and varied representations of concepts; can identify and apply principles; know and can apply facts and definitions; can compare, contrast, and integrate related concepts and principles; can recognize, interpret, and apply the signs, symbols, and terms used to represent concepts; and can interpret the assumptions and relations involving concepts in mathematical settings. Such understandings are essential to performing procedures in a meaningful way and applying them in problem-solving situations.

Procedural Knowledge

Students demonstrate procedural knowledge in mathematics when they provide evidence of their ability to select and apply appropriate procedures correctly, verify and justify the correctness of a procedure using concrete models for symbolic methods, and extend or modify procedures to deal with factors inherent in problem settings. Procedural knowledge includes the various numerical algorithms in mathematics that have been created as tools to meet specific needs in an efficient manner. It also encompasses the abilities to read and produce graphs and tables, execute geometric constructions, and perform noncomputational skills such as rounding and ordering.

Problem Solving

In problem solving, students are required to use their reasoning and analytic abilities when they encounter new situations. Problem solving includes the ability to recognize and formulate problems; determine the sufficiency and consistency of data; use strategies, data, models and relevant mathematics; generate, extend and modify procedures; use reasoning (i.e., spatial, inductive, deductive, statistical and proportional); and judge the reasonableness and correctness of solutions.

AVERAGE PROFICIENCY IN MATHEMATICS CONTENT AREAS FOR THE NATION

TABLE 3.1 presents average mathematics proficiency in each of the five content areas as well as in estimation for students in grades 4, 8, and 12 for both 1992 and 1990. As discussed in earlier chapters, there were significant gains in overall mathematics proficiency at all three grades assessed at the national level from 1990 to 1992.

At grade 4, this overall growth was reflected across the content areas: numbers and operations, measurement, geometry, and algebra and functions as well as for estimation. Data analysis, statistics, and probability was not assessed at grade 4 in 1990, so no comparison was possible in this area.

TABLE 3.1 **Average Proficiency in Mathematics Content Areas, Grades 4, 8, and 12**

Grades	Assessment Years	Average Proficiency	Numbers and Operations	Measurement	Geometry	Data Analysis, Statistics, and Probability	Algebra and Functions	Estimation
4	1992	218(0.7)>	216(0.8)>	224(0.8)>	221(0.7)>	219(0.9)	217(0.9)>	208(1.5)>
	1990	213(0.9)	210(1.1)	218(1.0)	213(0.9)	--	214(0.9)	200(1.5)
8	1992	268(0.9)>	272(0.8)>	266(1.2)>	263(0.9)>	268(1.1)>	267(1.0)>	271(1.3)
	1990	263(1.3)	267(1.3)	259(1.6)	260(1.3)	263(1.6)	261(1.2)	269(1.2)
12	1992	299(0.9)>	298(0.9)>	297(0.9)>	300(1.0)>	298(1.0)>	300(1.0)>	294(1.2)
	1990	294(1.1)	293(1.1)	292(1.3)	295(1.3)	294(1.2)	296(1.2)	292(1.2)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

At grade 8, there were significant gains in performance from 1990 in all mathematics content areas, but not in estimation. Parallel to the results at grade 8, twelfth graders also showed increased average proficiency in all content areas, but not in estimation.

STUDENTS' ACHIEVEMENT LEVELS IN ESTIMATION

Because the estimation section was administered via an audiotape which paced students through the questions, this portion of the assessment was piloted for the nation in 1990 and incorporated into the Trial State Assessment Program in 1992. As such, it was analyzed using a separate scale, which facilitated state-to-nation comparisons in 1990. Because these results are presented separately, NAGB developed achievement levels for this part of the assessment as well as for the overall composite mathematics scale encompassing the five content areas. The data for the estimation achievement levels are shown in TABLE 3.2. The scale-score cutpoints corresponding to the estimation achievement levels are shown in TABLE 3.3.

TABLE 3.2 National Percentages At or Above Achievement Levels in Estimation, Grades 4, 8, and 12

Grades	Assessment Years	Percentage of Students At or Above			Percentage Below Basic
		Advanced	Proficient	Basic	
4	1992	1(0.3)	30(1.7)>	91(1.1)	9(1.1)
	1990	0(0.4)	20(1.3)	90(1.8)	10(1.8)
8	1992	1(0.5)	20(1.8)	67(2.0)	33(2.0)
	1990	1(0.5)	18(1.6)	64(2.3)	36(2.3)
12	1992	4(0.7)	34(2.0)	82(1.7)	18(1.7)
	1990	4(0.9)	33(2.1)	79(1.6)	21(1.6)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level.

< The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 or less were rounded to 0 percent.

TABLE 3.3 Mathematics Proficiency (Scale-Score Cutpoint) Corresponding to Each Achievement Level, Grades 4, 8, and 12

Grades	Advanced	Proficient	Basic
4	286	229	158
8	328	295	258
12	340	307	269

In 1992, very few students attained the Advanced level at any of the three grades assessed -- an estimated 1 to 4 percent. However, 91 percent of the fourth graders were estimated to be at or above the Basic level and 30 percent to have reached the Proficient level. This latter finding represented a significant improvement at grade 4 compared to 1990, when 20 percent of the students were estimated to be at or above the Proficient level. There were virtually no changes in performance at grades 8 and 12 between 1990 and 1992. In 1992, it was estimated that two-thirds of the eighth graders performed at or above the Basic level and one-fifth attained the Proficient level. At grade 12, approximately four-fifths performed at or above the Basic level and one-third reached the Proficient level or higher.

PROFILES OF PROFICIENCY IN MATHEMATICS CONTENT AREAS BY PERCENTILES

TABLE 3.4 shows the national percentiles of mathematical proficiency for each of the five content areas and estimation at grades 4, 8, and 12. Examining these data for 1992 and 1990 by different content areas provides a cross-sectional view of changes in student performance for the entire distribution of performance. In the following discussion, special emphasis will be given to the 25th and 75th percentiles (the endpoints of the interquartile range), as they reflect the lower and upper ends of proficiency for the middle 50 percent of the student body. In some ways, these percentiles mark the lower and upper boundaries of "typical" student performance.

TABLE 3.4 Percentiles of Proficiency in Mathematics Content Areas, Grades 4, 8, and 12

	Assessment Years	5th Percentile	10th Percentile	25th Percentile	50th Percentile	75th Percentile	90th Percentile	95th Percentile

	1990	201(2.6)	214(2.9)	237(1.6)	262(1.1)	287(1.5)	308(2.2)	321(2.1)
Estimation	1992	222(4.3)	233(2.1)	251(2.0)	272(1.6)	291(1.9)	306(2.5)	315(2.9)
	1990	222(1.4)	232(1.3)	249(1.8)	269(2.3)	288(2.3)	305(1.2)	313(2.1)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at the 95 percent confidence level. The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

Note: There was no Data Analysis, Statistics, and Probability Scale in 1990 for grade 4.

TABLE 3.4 Percentiles of Proficiency in Mathematics Content Areas, Grades 4, 8, and 12 (continued)

	Assessment Years	5th Percentile	10th Percentile	25th Percentile	50th Percentile	75th Percentile	90th Percentile	95th Percentile
Grade 12								
Numbers & Operations	1992	244(1.6)	256(1.1)>	277(1.2)>	299(1.1)>	321(0.9)>	339(1.5)	349(1.3)
	1990	238(3.0)	249(1.7)	271(1.7)	294(1.0)	316(1.3)	335(1.7)	346(1.7)
Measurement	1992	234(1.3)	248(0.9)	272(1.1)	298(0.9)	324(1.2)>	344(1.9)	356(1.4)
	1990	230(2.8)	244(1.9)	268(2.1)	294(2.7)	318(0.9)	339(1.9)	351(1.9)
Geometry	1992	235(1.9)>	249(1.5)>	274(1.3)>	302(1.0)	328(1.2)	349(1.4)	362(1.7)
	1990	226(2.6)	240(1.8)	268(1.5)	297(2.2)	324(1.9)	347(2.0)	361(1.8)
Data Analysis	1992	238(1.6)	252(1.6)	275(1.4)	299(1.2)	322(1.1)	341(1.0)	352(1.7)
	1990	233(2.3)	248(1.6)	271(1.7)	297(1.2)	319(1.4)	338(1.8)	348(2.4)
Algebra & Functions	1992	238(1.4)	250(1.4)	273(1.1)	300(1.2)	327(1.5)	347(1.3)	358(0.9)
	1990	233(2.1)	246(1.8)	270(1.4)	297(1.3)	322(1.3)	343(1.5)	355(2.3)
Estimation	1992	248(2.3)	258(1.4)>	276(1.9)	295(1.5)	314(0.9)	328(2.1)	337(2.1)
	1990	241(3.0)	252(1.5)	273(1.6)	295(2.2)	313(1.3)	327(1.1)	337(3.9)

At grade 4, across the content areas there were more statistically significant increases for students in the higher performing half of the distribution than for those in the lower performing half, and similar results were observed for estimation. For example, a comparison of fourth graders' performance at the 25th percentile revealed significant gains from 1990 to 1992 only within the content area of geometry. At the 75th percentile, students in 1992 showed significant gains over the performance noted in 1990 in all mathematics areas measured in both assessments, except algebra and functions. (The interquartile ranges for the six areas were: numbers and operations-48, measurement-47, geometry-43, data analysis-44, algebra and functions-45, and estimation-50.)

The picture at grade 8 is very similar. All the statistically significant increases in performance within the content areas were for students in the higher performing half of the distributions. At the 25th as well as 10th and 5th percentiles, there was no mathematics area in which the increases in performance from 1990 to 1992 reached statistical significance. At the 75th percentile level, there were significant gains from 1990 to 1992 in the areas of numbers and operations, measurement, data analysis, and algebra and functions. (The interquartile ranges for the six areas were: numbers and operations-49, measurement-63, geometry-49, data analysis-58, algebra and functions-51, and estimation-40.)

At grade 12, there was a pattern of apparent improvement between 1990 and 1992 within most of the content areas moving from the 5th percentile across to the 95th percentile level even though many of the differences were not statistically significant. However, for the high-school seniors there was more statistically significant improvement for the lower half of the distribution than the upper half. For example, at the 25th percentile level, students showed significant improvement from 1990 proficiency levels in numbers and operations and in geometry. At the 10th percentile, there was improvement in estimation as well.

Mirroring the fourth and eighth graders, the 75th percentile at the twelfth grade increased significantly in numbers and operations and measurement. However, there were no significant gains at the 90th or 95th percentiles in any content area. (The interquartile ranges for the grade 12 data reflected the following spreads: numbers and operations-44, measurement-52, geometry-54, data analysis-47, algebra and functions-54, and estimation-38.)

AVERAGE PROFICIENCY IN MATHEMATICS CONTENT AREAS BY REGION

TABLE 3.5 presents average content-area proficiency for students attending school in four regions of the country -- Northeast, Southeast, Central, West. The results indicate that the general pattern of national gains across content areas at all three grades was not necessarily reflected in each region.

At grade 4, the data reveal a relatively stable ordering of the regions from 1990 to 1992 with respect to average proficiency across the content areas. In general, the students in the Northeast and Central regions had consistently higher proficiencies than those from the Southeast, with students from the West performing somewhere in between. For example, in measurement, data analysis, and algebra and functions, average proficiencies in the Central and Northeast

TABLE 3.5 Average Proficiency in Mathematics Content Areas by Region, Grades 4, 8, and 12

	Assessment Years	Numbers and Operations	Measurement	Geometry	Data Analysis, Statistics, and Probability	Algebra and Functions	Estimation

Grade 12							
Northeast	1992	301(1.4)	300(1.5)	303(1.6)	300(1.6)	304(1.7)	294(3.1)
	1990	298(1.9)	298(2.8)	302(2.7)	300(2.7)	302(2.4)	296(3.0)
Southeast	1992	293(1.3)>	285(1.5)	292(1.6)>	291(1.6)	292(1.8)	290(2.5)
	1990	285(2.1)	280(2.6)	282(2.3)	285(2.5)	286(2.3)	286(2.2)
Central	1992	302(1.7)>	303(2.1)>	305(1.9)	303(2.0)	304(2.1)	297(1.9)
	1990	296(2.4)	296(2.8)	299(3.2)	298(2.4)	298(2.8)	295(1.7)
West	1992	297(1.6)	300(1.9)	301(2.1)	296(2.3)	298(1.7)	295(2.5)
	1990	293(2.4)	294(3.0)	295(2.9)	293(2.5)	295(2.7)	292(3.2)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

Note: There was no Data Analysis, Statistics, and Probability Scale in 1990 for grade 4.

regions were significantly higher than those in the Southeast. In numbers and operations and in geometry, average proficiency in the Southeast was significantly lower than in the other three regions. In estimation, the only difference was between the Central and Southeast regions, where average proficiency of the students in the Central region was 20 scale points higher.

In the Central region, fourth graders showed significant gains in numbers and operations, measurement, and geometry. The Southeast improved in measurement and geometry, and the West improved in estimation.

At grade 8, the ordering of regions from high to low average proficiency was virtually identical from one content area to the next in both assessments -- Central, Northeast, West, and Southeast. However, the only statistically significant differences in proficiency were between the Central and Southeast regions and these occurred for every mathematics area except estimation. Eighth graders in the Central region had significantly higher average proficiencies in 1992 than they did in 1990 in each of the five content areas, but not in estimation. The West showed gains in both numbers and operations and measurement, and the Southeast improved in measurement. In contrast, an interesting pattern was noted for eighth graders in the Northeast, where performance was essentially the same from assessment to assessment. However, several content areas showed a slight, but not significant, decrease over the two years.

At grade 12, students in the Central, Northeast, and West regions tended to perform better across the content areas than did those in the Southeast. For example, in numbers and operations, data analysis, and algebra and functions, twelfth graders' proficiencies in the Central and Northeast regions were significantly higher than those in the Southeast. In measurement and geometry, the students in the Southeast had significantly lower proficiencies than did students in the other three regions. However, among the few statistically significant increases noted at grade 12 were those for both numbers and operations and geometry proficiency in the Southeast from 1990 to 1992. The other significant gains were for the Central region in numbers and operations and measurement.

Across the regions and grades assessed, more gains were posted in numbers and operations, measurement, and geometry as compared with data analysis, statistics, and probability; algebra and functions; and estimation.

Average Proficiency in Mathematics Content Areas for the States

TABLE 3.6 presents the data for average proficiency in the content areas from the 1992 Trial State Assessments at grades 4 and 8, plus the 1990 data for grade 8.

At grade 8, three states showed increased performance across all five content areas -- Hawaii, North Carolina, and Rhode Island. Minnesota showed improvement in four content areas, all but numbers and operations. Colorado and New Hampshire had increases in three areas. For Colorado, improvement was noted in numbers and operations, measurement, and algebra and functions. For New Hampshire, improvement was noted in numbers and operations, measurement, and data analysis. States showing significant improvement in two content areas included Idaho, Iowa, and Texas: all three posted gains in measurement as well as in algebra and functions. Also, the District of Columbia improved in numbers and operations as well as in data analysis, Kentucky in numbers and operations as well as in measurement, and Guam in data analysis as well as in algebra and functions. Additionally, Arizona improved in algebra and functions, California in measurement, Connecticut in measurement, New Mexico in numbers and operations, New York in numbers and operations, Oklahoma in measurement, Wyoming in measurement, and the Virgin Islands in data analysis.

FIGURE 3.3 presents average performance across the content areas by 20 percent bands or "quintiles" for the participating jurisdictions. Iowa, Maine, Minnesota, New Hampshire, North Dakota, and Wisconsin had average proficiency in the top 20 percent across the participating jurisdictions in all five content areas and estimation at both grade levels. For some states and territories, performance was not as consistent either within a grade or across grades. For example, Connecticut, which was consistently in the top 20 percent at grade 4, tended to have performance in the second highest quintile at grade 8. Conversely, average proficiency in Idaho tended to be in the second to the top quintile at grade 4, but in the top quintile at grade 8.

Wyoming	221 (1.1)	230 (1.2)	228 (1.1)	224 (1.1)	222 (1.2)	216 (1.1)
TERRITORY						
Guam	188 (1.1)	192 (1.1)	201 (1.2)	189 (0.9)	192 (1.0)	173 (0.8)

The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

»The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. «The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

Guam (GU)	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Virgin Islands (VI)	NA	NA	NA	NA	NA	NA	NA	1	1	1	1	1	1	1

States categorized in the bottom 20 percent of performance have average mathematics proficiencies in the lowest fifth of the average mathematics proficiency distribution of all states and are indicated by the number 1 (first quintile). States with average proficiencies in the top 20 percent of the distribution are indicated by the number 5 (fifth quintile). The numbers 2, 3, and 4 indicate states with average proficiencies in the second, third, and fourth fifths of the distribution.

NA- Grade 4 data for the Virgin Islands are not available.

The following sections describe the results for top-performing states and territories, content area by content area. The analysis considers the cluster of states relative to their overall mathematics proficiency as shown in FIGURES 1.5 and 1.6. Also, at the eighth grade, trends from 1990 to 1992 will be discussed. For reference purposes, the clusters of states with the highest overall average mathematics proficiency at grades 4 and 8 are shown below.

Top-Performing States in Overall Mathematics Proficiency (from Figures 1.5 and 1.6)

Grade 4	Maine, Iowa, New Hampshire, Wisconsin, North Dakota, Minnesota, New Jersey, Connecticut, Massachusetts, Nebraska
Grade 8	Iowa, North Dakota, Minnesota, Maine, New Hampshire, Wisconsin, Nebraska

State Performance in Numbers and Operations

The state-by-state comparisons for average proficiency in numbers and operations at grade 4 are shown in FIGURE 3.4. In general, average proficiency for the participating states and territories is relatively the same in numbers and operations as for overall mathematics proficiency. However, the highest performing cluster increased from 10 states overall to 12 states for numbers and operations, with the inclusion of Wyoming and Pennsylvania.

FIGURE 3.5 shows the same information for numbers and operations for students in grade 8. Here again, the picture is essentially the same as for overall mathematics proficiency. The states cluster in essentially the same groups. This is easily seen when FIGURE 1.6 is overlaid on FIGURE 3.5. North Dakota, Iowa, Minnesota, Wisconsin, and Maine are the five states comprising the top-performing cluster for numbers and operations (but not including New Hampshire and Nebraska as in FIGURE 1.6).

TABLE 3.7 presents the percentiles for numbers and operations across jurisdictions for the 1992 Trial State Assessment Program. The trends for grade 8 indicate that the participants with significant increases in average proficiency in numbers in operations included Colorado, the District of Columbia, Hawaii, Kentucky, New Hampshire, New Mexico, New York, North Carolina, and Rhode Island. Also, several states showed improvement at specific percentiles.

Comparisons of Numbers and Operations Average Proficiency 1992 Grade 4

Read **down** the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Comparisons of Numbers and Operations Average Proficiency 1992 Grade 8

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Guam	188 (1.1)	125 (2.8)	138 (1.8)	162 (1.3)	188 (1.5)	214 (1.7)	236 (2.5)	250 (2.0)

The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample.

>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

State Performance in Measurement

FIGURE 3.6 shows the state-by-state comparative performance in measurement at grade 4 in 1992. Again, the states in the top grouping remained fairly stable, with the group of high-performing states in average measurement growing from 10 states overall to 13 states. States moving into the top group for measurement were Wyoming, Utah, and Pennsylvania.

FIGURE 3.7 shows comparative information about average proficiency in measurement for grade 8 at the state level in 1992. The picture is very similar to the overall mathematics proficiency information. The top seven states are the same seven states that formed the top group in overall mathematics proficiency.

TABLE 3.8 contains the data showing the percentiles for measurement. Across the participating jurisdictions at grade 8, California, Colorado, Connecticut, Hawaii, Idaho, Iowa, Kentucky, Minnesota, New Hampshire, North Carolina, Oklahoma, Rhode Island, Texas, and Wyoming had significantly higher average proficiency in measurement in 1992 than in 1990. There were numerous improvements across the percentiles, with Iowa, Minnesota, and North Carolina showing improvement at five of the percentiles shown.

FIGURE 3.6

Comparisons of Measurement Average Proficiency 1992 Grade 4

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- No statistically significant difference from the state listed at the top of the chart.
- State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Comparisons of Measurement Average Proficiency 1992 Grade 8

Read **down** the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

(xxx) Did not participate in the 1990 Trial State Assessment.

State Performance in Geometry

FIGURE 3.8 shows the comparative state-by-state performance in geometry at grade 4 in 1992. Here the state groupings by average proficiency show a marked change from that observed for overall mathematics performance. The top group of states essentially consists of 13 states, including Maine, New Hampshire, and Connecticut. However, fourth graders in Minnesota, Iowa, North Dakota, Nebraska, Massachusetts, Wisconsin, Wyoming, Utah, Colorado and New Jersey performed as well as, if not better than, fourth graders in all other participating jurisdictions except those in Maine. While there are a few minor differences between states in this group, their overall performance is very similar.

FIGURE 3.9 shows the state-by-state performance and differences for the area of geometry at grade 8 for 1992. In contrast to the similar geometry performance in quite a few states at grade 4, the pattern of performance at grade 8 is almost identical to that for overall mathematics proficiency.

TABLE 3.9 contains information on the percentile distributions for student proficiency in geometry at grade 4 in 1992 and at grade 8 in both 1992 and 1990. Compared to numbers and operations and measurement, there were fewer improvements at grade 8 between 1992 and 1990 in the area of geometry. Across the 37 jurisdictions that participated in both assessments, statistically significant improvements in average geometry proficiency occurred only in Hawaii, Minnesota, North Carolina, and Rhode Island. Consistent with the few participating jurisdictions showing improvements in average geometry proficiency, there were few improvements across the percentiles.

Comparisons of Geometry Average Proficiency 1992 Grade 4

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Comparisons of Geometry Average Proficiency 1992 Grade 8

INSTRUCTIONS:

Read **down** the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Guam	201 (1.2)	144 (4.2)	157 (2.6)	179 (2.2)	202 (1.6)	225 (1.7)	244 (1.7)	256 (2.5)

The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

State Performance in Data Analysis, Statistics, and Probability

The fourth content area assessed as part of the 1992 NAEP mathematics cycle was data analysis, statistics, and probability. FIGURE 3.10 displays the results from the state-by-state consideration of student performance at grade 4 for this content area. The distribution of performance here is very similar to that displayed in FIGURE 1.5 for overall performance in mathematics, even though this content dimension is perhaps the newest area of study added to the elementary school mathematics curriculum.

The same 10 states as for overall mathematics proficiency are in the top group, with the addition of Pennsylvania. One also could add the states of Wyoming, Virginia, and Missouri to the top group, because the only state the latter three have any significant difference with is Maine.

FIGURE 3.11 displays the state patterns of average proficiency for the content area of data analysis for grade 8 students. As in the other content areas, there is considerable similarity between this graph and the one shown for overall grade 8 mathematics performance in FIGURE 1.6. The same seven states form the top group in the upper left hand corner of the graph. Average proficiency in data analysis for these seven states did not differ statistically.

TABLE 3.10 contains the state-by-state percentile distributions for data analysis, statistics, and probability performance at grades 4 and 8. The grade 8 trends in average proficiency reveal significant improvement across jurisdictions for the District of Columbia, Hawaii, Minnesota, New Hampshire, North Carolina, Rhode Island, Guam, and the Virgin Islands. Hawaii, North Carolina, and Guam showed increases for the lower part of the distribution for this content area -- 5th, 10th, and 25th percentiles. Colorado and Minnesota had improvement for the higher end of their distributions at the 75th, 90th, and 95th percentiles. The Virgin Islands showed increases at the 5th, 10th, 25th, 50th, and 75th percentiles.

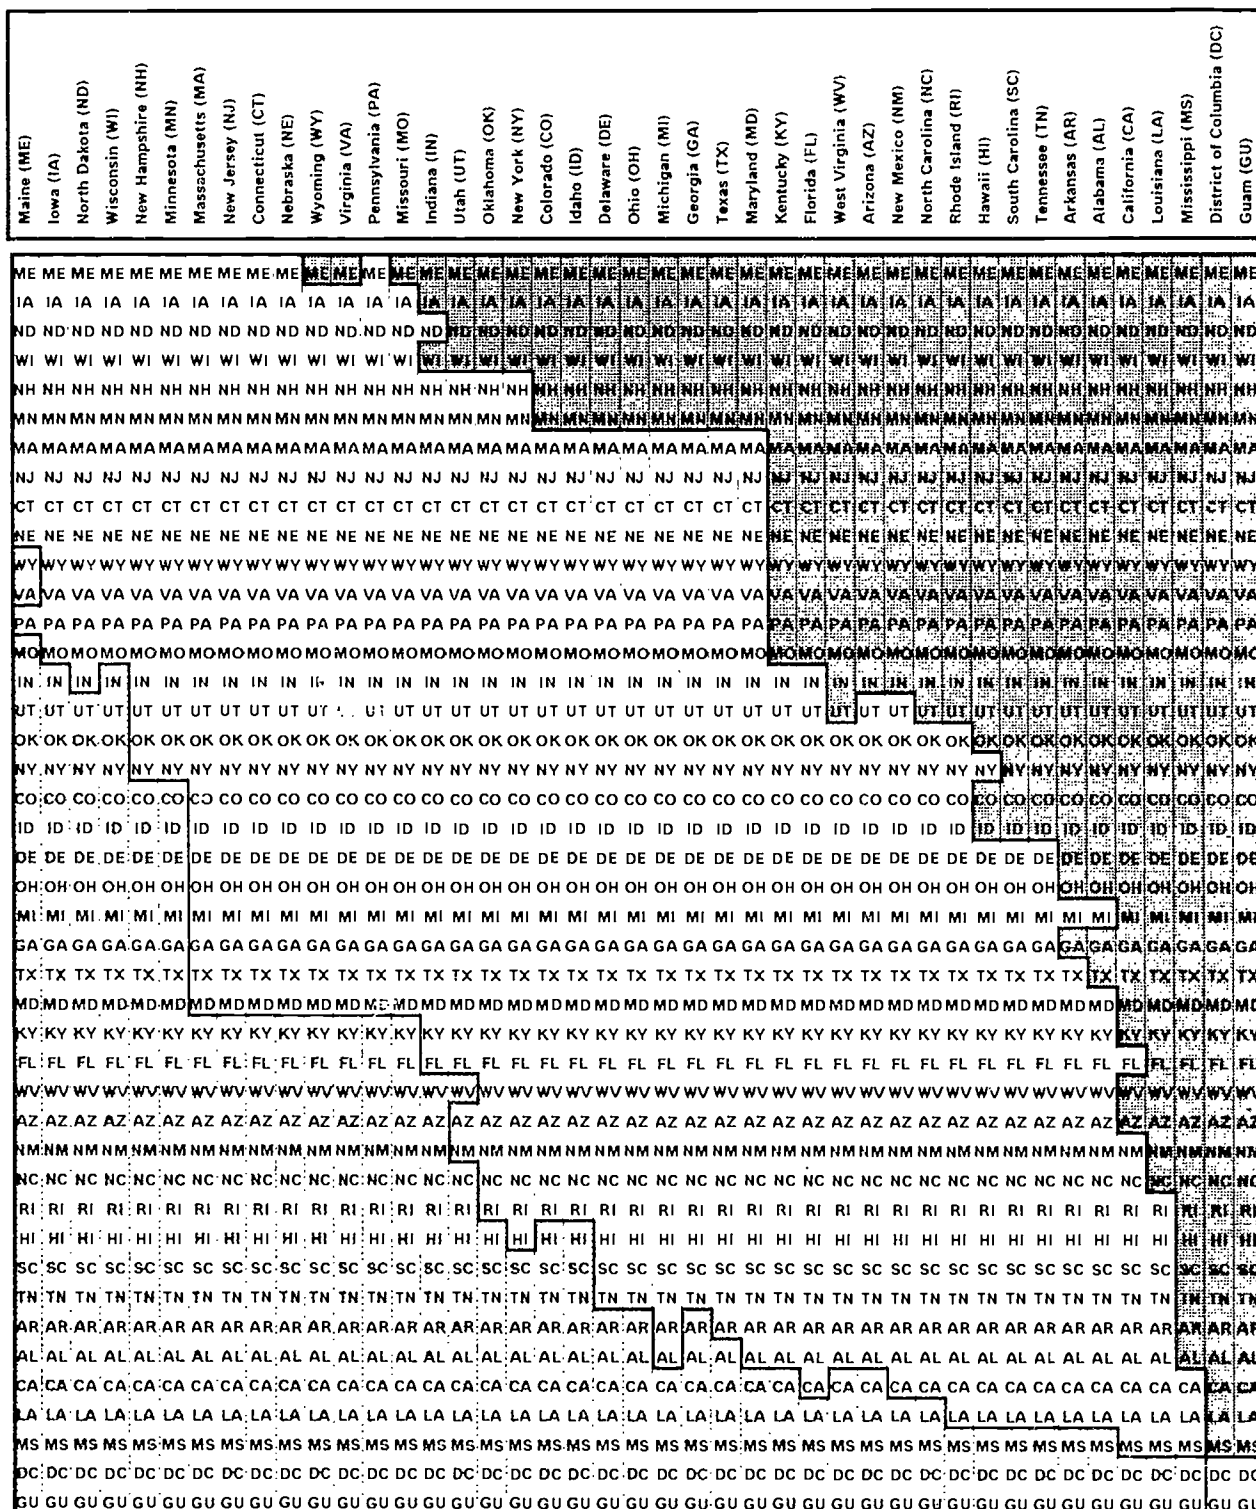

FIGURE 3.10

Comparisons of Data Analysis, Statistics, and Probability

Average Proficiency

1992 Grade 4

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

State Performance in Algebra and Functions

The fifth mathematics content area assessed was algebra and functions. The pattern of performance at grade 4 in FIGURE 3.12 displays a different picture of state-by-state achievement than that seen for the other content areas. The top-performing group expanded from 10 to 15 states to also include Wyoming, Pennsylvania, Utah, Missouri, and Indiana.

As shown in FIGURE 3.13, the pattern of performance in algebra and functions at grade 8 was similar to overall mathematics performance at that grade. Minnesota, Iowa, North Dakota, Nebraska, and Wisconsin formed the top group with New Hampshire, Idaho, Maine, and New Jersey also having performance similar to all of these except Minnesota.

TABLE 3.11 contains the state-by-state percentile distributions for algebra and functions at grades 4 and 8. Viewing significant increases in performance across participating jurisdictions reveals improvement in algebra and functions by Arizona, Colorado, Hawaii, Idaho, Iowa, Minnesota, North Carolina, Rhode Island, Texas, and Guam. Five of the 37 states and territories showed growth in their performance at the 25th percentile, and six did at the 50th percentile.

Comparisons of Algebra and Functions Average Proficiency 1992 Grade 4

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

Comparisons of Algebra and Functions Average Proficiency 1992 Grade 8

Read **down** the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors

Guam	192 (1.0)	134 (3.9)	146 (3.3)	168 (1.7)	192 (1.1)	216 (1.8)	238 (1.6)	249 (2.7)

The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

State Performance in Estimation

FIGURE 3.14 presents the grade 4 comparisons in average performance across participating jurisdictions for the estimation portion of the assessment. The results were parallel to those for overall performance, although Wyoming was among the top-performing states and New Jersey did have lower average proficiency than Minnesota.

The state-by-state estimation results for grade 8 are shown in FIGURE 3.15. Minnesota, North Dakota, and Iowa had similar average proficiency in estimation and comprised the top-performing states. Average proficiency in Wisconsin also was similar to that in North Dakota and Iowa.

TABLE 3.12 contains the percentiles for estimation for grades 4 and 8. Because estimation was not part of the 1990 Trial State Assessment Program, trend data are not available. However, the achievement level results for 1992 are presented in TABLE 3.13 for both grades 4 and 8. Paralleling the national findings, few students at either grades 4 or 8 attained the Advanced level of performance (from 0 to 3 percent). However, approximately 90 percent or more of the fourth graders in 27 of the participating jurisdictions were estimated to be at or above the Basic level, and in most states at least one-fifth of the students performed at or above the Proficient level. At grade 8, in general, it was estimated that from approximately one-half to three-fourths performed at or above the Basic level and from one-tenth to one-third reached the Proficient level.

Comparisons of Estimation Average Proficiency 1992 Grade 4

INSTRUCTIONS: Read *down* the column directly under a state name listed in the heading at the top of the chart. Match the shading intensity surrounding a state postal abbreviation to the key below to determine whether the average mathematics performance of this state is higher than, the same as, or lower than the state in the column heading.

- ☒ State has statistically significantly higher average proficiency than the state listed at the top of the chart.
- ☐ No statistically significant difference from the state listed at the top of the chart.
- ☐ State has statistically significantly lower average proficiency than the state listed at the top of the chart.

The between state comparisons take into account sampling and measurement error and that each state is being compared with every other state. Significance is determined by an application of the Bonferroni procedure based on 946 comparisons by comparing the difference between the two means with four times the square root of the sum of the squared standard errors.

TERRITORY								
Guam	173 (0.8)	115 (2.3)	127 (2.0)	149 (1.6)	173 (1.2)	196 (1.0)	216 (1.6)	229 (1.3)

The standard errors of the estimated proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. [!] Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

Wyoming	216 (1.1)	0 (0.2)	34 (1.3)	97 (0.6)	3 (0.6)
TERRITORY					
Guam	173 (0.8)	0 (0.1)	5 (0.6)	67 (1.4)	33 (1.4)

The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

Virginia	271 (1.1)	2 (0.6)	19 (1.3)	68 (1.6)	32 (1.6)
West Virginia	263 (0.8)	0 (0.1)	9 (0.7)	58 (1.5)	42 (1.5)
Wisconsin	278 (1.1)	2 (0.7)	26 (1.3)	78 (1.6)	22 (1.6)
Wyoming	276 (0.9)	1 (0.3)	22 (1.3)	78 (1.5)	22 (1.5)
TERRITORIES					
Guam	244 (1.1)	0 (0.1)	4 (0.7)	32 (1.5)	68 (1.5)
Virgin Islands	231 (1.5)	0 (0.0)	1 (0.2)	15 (1.7)	85 (1.7)

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Descriptions of mathematics proficiency at the three achievement levels are found in Chapter One.

Summary

The overall analysis of the content area information suggests a strong pattern of overall student growth across the nation in content area proficiency at grades 4, 8, and 12. Significant growth took place at all grade levels in numbers and operations and in measurement. In geometry, significant growth occurred at grade 4 and at grade 12. In algebra and functions, there were significant gains at grades 4 and 8. However, the results indicate more movement in the top half of the performance distribution at grades 4 and 8 than in the bottom half, while the converse was found at grade 12.

The results for the 37 jurisdictions that participated in both the 1990 and 1992 mathematics assessments at grade 8 revealed gains for a number of states across the content areas, especially in numbers and operations, measurement, and algebra and functions. The latter improvements are consistent with recommendations contained in the *NCTM Curriculum and Evaluation Standards* to strengthen the emphasis on algebra at the eighth grade. In general, the top-performing and lower-performing jurisdictions within each of the content areas mirrored the data for overall mathematics proficiency. However, some differences were noted, particularly for algebra and functions in the fourth grade, where 15 of the participants were found among top-performing states.

Six states, including Iowa, Maine, Minnesota, New Hampshire, North Dakota, and Wisconsin, had average proficiency in the top 20 percent of the participating jurisdictions for all five content areas and estimation at both grades 4 and 8.

Despite the general tendency for gains between assessments to be found in some content areas more than in others and at particular parts of the proficiency distribution more than others, the results do indicate that the improvements in overall mathematics proficiency described in Chapter One were reasonably well dispersed across the mathematics content areas.

APPENDIX A

What Students Know and Can Do in Mathematics: NAEP's Anchor-Level Results

Introduction

Scale anchoring is a procedure to describe performance at particular points or "anchor" levels on the 0 to 500 NAEP scale. More specifically, based on students' performance on the assessment questions, mathematics understandings are described that represent gains from one anchor level to the next; that is, what students know and can do at one level that differentiates them from students performing at lower levels. The descriptions of advances in mathematical understanding from one anchor level to the next are presented together with percentages of students performing at or above each level.

The NAEP mathematics scale was anchored at 50-point intervals -- 200, 250, 300, and 350. In theory, NAEP could have defined proficiency levels above 350 or below 200; however, so few students in the assessment performed at the extreme ends of the scale that it was not useful to do so.

To develop the descriptions, first an empirical process was used to delineate sets of questions typical of what students know and can do at the anchor intervals on the scale -- sets of items that students at one level were more likely to answer correctly than were students at the next lower level.²³ The four sets of anchor questions -- each containing from 33 to 88 questions -- were studied by a panel of mathematics educators, who carefully considered and articulated the types of knowledge, skills, and reasoning abilities demonstrated by correct responses.

For this report containing 1992 results, the 1990 anchoring process was replicated to update the descriptions used previously in reporting the 1990 assessment results.²⁴ Some items in the 1992 assessment were carried forward from 1990 to provide a basis for measuring trends, but others were newly developed measures of the mathematics framework intended to reflect improvements in ways of assessing mathematics achievement. Thus, the updated descriptions provided in this report reflect the evolution of the 1992 items.

Descriptions of Overall Mathematics Proficiency for the Nation and the States

TABLE A.1 presents the average mathematics proficiency for fourth, eighth, and twelfth graders and the percentages of students in each grade performing at or above the four anchor levels in both 1992 and 1990. The corresponding information for states and territories participating in the 1992 Trial State Assessments is found in TABLE A.2. In making comparisons between national, regional, and state performance, the data found at the top of TABLE A.2 should be used. Whereas the national results provided in TABLE A.1 are based on students attending both private and public schools, the

²³For more detailed descriptions of the scale anchoring process and how it is implemented, please see:

Gary W. Phillips, et al., *Interpreting NAEP Scales* (Washington, D.C.: National Center for Education Statistics, U.S. Government Printing Office, 1993).

²⁴Ina V.S. Mullis, et al., *The State of Mathematics Achievement* (Washington, D.C.: National Center for Education Statistics, U.S. Government Printing Office, 1991).

national, regional, and state data found in TABLE A.2 are based only on students attending public schools. In general, the two data sets for the nation and regions of the country are very similar, but the national figures including private school students are usually 1 to 2 percentage points higher than those in the state comparison sample. Also, it should be remembered that the regional results for the state comparisons are based on the national samples and not on an aggregate of participating states for that region, which would not necessarily have been representative of regional performance. Finally, although trend results from 1990 are available for the nation at all three grades and the states at grade 8, the Trial State Assessments were not conducted at grade 4 in 1990. The descriptions summarizing performance at the four anchor levels are found in FIGURE A.1.

TABLE A.1 National Overall Average Mathematics Proficiency and Anchor Levels, Grades 4, 8, and 12

		Assessment Years	Grade 4	Grade 8	Grade 12
Average Proficiency		1992	218(0.7)>	268(0.9)>	299(0.9)>
		1990	213(0.9)	263(1.3)	294(1.1)
Level	Description	Percentage of Students At or Above			
200	Addition and Subtraction, and Simple Problem Solving with Whole Numbers	1992	72(0.9)>	97(0.4)	100(0.1)
		1990	67(1.4)	95(0.7)	100(0.2)
250	Multiplication and Division, Simple Measurement, and Two-Step Problem Solving	1992	17(0.8)>	68(1.0)	91(0.5)>
		1990	12(1.1)	65(1.4)	88(0.9)
300	Reasoning and Problem Solving Involving Fractions, Decimals, Percents, and Elementary Concepts in Geometry, Statistics, and Algebra	1992	0(0.1)	20(0.9)>	50(1.2)>
		1990	0(0.1)	15(1.0)	45(1.4)
350	Reasoning and Problem Solving Involving Geometric Relationships, Algebra, and Functions	1992	0(0.0)	1(0.2)	6(0.5)
		1990	0(0.0)	0(0.2)	5(0.8)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

**FIGURE A.1 Description of Mathematics Proficiency for
Four Anchor Levels on the NAEP Scale**

Level 200	Addition and Subtraction, and Simple Problem Solving with Whole Numbers
------------------	--

Students at this level can identify solutions to one-step word problems, involving addition or subtraction. They can add and subtract whole numbers in most situations, and when a calculator is available, they can multiply and divide. They are able to select the largest whole number from a set of numbers in the thousands, and can match the verbal and symbolic names for numbers.

Students demonstrate familiarity with length and weight, by selecting appropriate instruments and units to measure these attributes. They are able to recognize some basic properties of two-dimensional geometric figures as well as the names of standard examples of these figures. They can recognize simple patterns.

Level 250	Multiplication and Division, Simple Measurement, and Two-Step Problem Solving
------------------	--

When presented with a problem situation, students at this level have some understanding of the problem, can identify extraneous information, and have some knowledge of when to use computational estimation. They have an understanding of addition, subtraction, multiplication, and division with whole numbers. They can solve simple two-step problems involving whole numbers. They are able to round whole numbers and solve simple word problems involving place value, estimation, and multiples.

Students can use a ruler to measure length in centimeters and have some understanding of area and perimeter. They can solve simple problems using readings from instruments. They demonstrate a knowledge of properties of triangles, squares, rectangles, circles, and cubes. They can solve problems that require visualizing, drawing or manipulating simple geometric shapes. They are able to complete bar graphs and pictographs, as well as use information from graphs or tables to solve simple problems. They can recognize simple number patterns, are beginning to deal informally with the idea of a variable, and have some knowledge of simple probability.

Level 300**Reasoning and Problem Solving Involving Fractions, Decimals, Percents, Elementary Concepts in Geometry, Statistics, and Algebra**

Students at this level can use various strategies and explain their reasoning in a variety of problem-solving situations. They are able to solve problems involving not only whole numbers but with decimals and fractions. They can represent and find equivalent fractions, and use these concepts in solving routine problems. They can find a percent of a number and use this skill in simple problems. Multiplication and division of whole numbers have developed to the extent that students can use all four operations in multi-step problems.

Students can read and use instruments in more complex situations. They can find areas of rectangles, recognize relationships among common units of measure, and solve routine problems involving similar triangles and scale drawings. They have knowledge of definitions and properties of simple geometric figures in the plane. Their spatial sense includes the ability to visualize a cube in either three-space or its flattened form in a plane.

Students can calculate averages, select and interpret data from a variety of graphs, list the possible arrangements in a sample space, find the probability of a simple event, and have a beginning understanding of sample bias. They can use knowledge of relative frequencies in simple simulation situations. Students show the ability to evaluate simple expressions and solve linear equations. Students can graph points on coordinate axes, locate the missing coordinates for a corner of a square, and identify which ordered pairs satisfy a given linear equation.

Level 350**Reasoning and Problem Solving Involving Geometric Relationships, Algebra, and Functions**

Students at this level can reason and estimate with percents. They can recognize scientific notation and find the decimal equivalent. They can apply their knowledge of area and perimeter of simple geometric figures to solve problems. They can find the circumferences of circles and the surface areas of solid figures. They can solve for the length of missing segments in more complex similarity situations. Students can apply the Pythagorean Theorem to find the hypotenuse of a right triangle. They are beginning to use rectangular coordinates in problem-solving situations and can apply geometric properties and relationships in solving problems.

Students can compute means from frequency tables and create a sample space to determine probabilities, and read the graph of a step-function. Students can use exponents and evaluate expressions given in functional notation. In number theory, they have an understanding of even and odd numbers and their properties. They can identify an equation describing a linear relation provided in a table, and solve literal equations and systems of two linear equations. They have some knowledge of trigonometric relations. These students can represent and interpret complex patterns and data using numbers, expressions, and graphs. Given the graph of a function they can identify its zeros and the effect on the graph of taking the absolute value of the function.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated. (xxx) Did not participate in the 1990 Trial State Assessment.

At grade 4, for the nation, 72 percent of the students were estimated to have performed at or above Level 200, demonstrating some success with addition and subtraction of whole numbers, including simple problem solving. This represented an increase compared to 1990, when 67 percent of the fourth graders were estimated to be at or above this level. For the states, the percentages of students performing at or above Level 200 were estimated to have ranged from 50 to 86 percent. The percentages of students performing at or above this level were lower for the District of Columbia (37 percent) and Guam (40 percent).

Seventeen percent of the fourth graders nationally (16 percent for state comparison purposes) were estimated to be at or above Level 250, indicating some success with all four operations with whole numbers, including some two-step problems. For the nation as a whole, this represented an improvement from 1990, when approximately 12 percent of the fourth graders performed at or above Level 250. Across participating jurisdictions, there was quite a range in performance: 4 to 26 percent of the students were estimated to have performed at or above this level.

Virtually no fourth graders performed at or above Level 300 in the nation in either 1992 or 1990, or in the states in 1992. Nevertheless, an estimated 1 percent of the fourth graders in Connecticut, Maine, and Virginia did reach this level.

At grade 8, for the nation, it was estimated that almost all students performed at or above Level 200 in both 1992 and 1990. This result was also true for the states in general (from 90 to 100 percent), except in the District of Columbia or the territories where smaller percentages were estimated to have reached this level in either 1992 or 1990 (from 74 to 83 percent). Hawaii, North Carolina, and Rhode Island showed improvement between assessments at Level 200.

Two-thirds of the eighth graders nationally were estimated to be at or above Level 250 in 1992, and this represented essentially no change from 1990. As in 1990, performance in 1992 showed considerable differences among participating jurisdictions at Level 250. For example, it was estimated that Idaho, Iowa, Maine, Minnesota, Nebraska, New Hampshire, North Dakota, and Wisconsin had 80 percent or more of their eighth graders performing at or above Level 250. In contrast, 50 percent or fewer of the eighth graders were estimated to have reached this level in the District of Columbia, Louisiana, Mississippi, Guam, and the Virgin Islands. Between 1990 and 1992, ten states showed increased percentages of their students performing at or above Level

250 -- Colorado, the District of Columbia, Hawaii, Iowa, Kentucky, Minnesota, New Hampshire, North Carolina, Oklahoma, and Rhode Island.

Nationally, about one-fifth of the eighth graders were estimated to be at or above Level 300. Compared to 1990, the nation as a whole and six states -- Colorado, Iowa, Minnesota, New York, North Carolina, and Texas -- showed improved performance at this level. Still in 1992, the top-performing states had only approximately one-fourth of their students estimated to have reached this level, which is typified by an understanding of mathematics beyond whole numbers including fractions, decimals, and percents as well as some familiarity with elementary concepts in geometry, statistics, and algebra. At best, across the two assessments in the nation and participating jurisdictions, an estimated 1 percent of the eighth graders performed at or above level 350.

Several states showed gains at more than one anchor level for their eighth graders, indicating movement across the distribution of mathematical achievement: Hawaii and Rhode Island at Levels 200 and 250; Colorado, Iowa, and Minnesota at Levels 250 and 300; and North Carolina at Levels 200, 250, and 300.

At grade 12, it was estimated that about 90 percent of the students performed at or above Level 250 in both assessments. The percentage estimated to be at or above Level 300 rose from 45 percent in 1990 to 50 percent in 1992. The estimated percentage attaining Level 350, characterized by reasoning and problem solving involving geometric relationships, algebra, and functions, remained essentially constant from 1990 to 1992 -- at about 5 to 6 percent.

Performance at Each Anchor Level and Example Items

The next section describes performance at each of the anchor levels in some detail, providing several example questions that typify the range of performance at that level. That is, each level is illustrated by tasks that were performed correctly by about 60 percent to nearly all of the students at that level, and that were more difficult for students at the lower levels. The full set of anchor questions released to the public is contained in the *1992 Mathematics Data Compendium for the Nation and the States*.²⁵

²⁵National Center for Education Statistics, *1992 Mathematics Data Compendium for the Nation and the States* (Washington, D.C.: Author, U.S. Government Printing Office, 1993).

Level 200

Addition and Subtraction, and Simple Problem Solving With Whole Numbers

Performance at Level 200 is typified by a grasp of how to compute with whole numbers and perform simple word problems involving addition and subtraction. Students at this level also showed familiarity with the attributes of length and weight and were able to recognize simple geometric figures and visual patterns.

Nationally, more fourth graders were estimated to have performed at or above this level in 1992 than in 1990, 72 compared to 67 percent. Most eighth graders and all the twelfth graders performed at this level in both assessments. For the jurisdictions participating in the Trial State Assessments, there was considerable variation in the percentages of fourth graders estimated to have reached this level -- from 37 to 86 percent. With the exception of the District of Columbia and the two participating territories, 90 percent or more of the eighth graders were estimated to be at or above this level. In each jurisdiction, performance at this level was virtually equivalent in the two assessments, with the exception of increases for Hawaii, North Carolina, and Rhode Island.

The following questions from the assessment illustrate the range of questions likely to be answered correctly by students performing at or above Level 200. Because the percentage correct for each question includes all the students in the assessment, and not just those performing at the anchor level being described, the percentage of students across the nation answering a question correctly -- regardless of mathematics proficiency on the NAEP scale -- will usually differ from the percentage attaining that anchor level. For example, at grade 4 about three-fourths of the students were estimated to be at or above Level 200. These students were likely to answer the question shown below correctly, but so were some of the other students not reaching 200. Thus, keep in mind that the percentage of students attaining an anchor level and the percentage of students answering an item correctly -- based on all the students assessed regardless of achievement on the scale -- can be different. The first describes the percentage of students demonstrating relatively consistent performance over a collection of tasks; the second shows the percentage of the population that answered the specific question correctly. The standard errors for the percentages of students answering items correctly are shown in parentheses.

The first question shown below exemplifies the type of whole number computation tasks that could be performed successfully by students performing at or above Level 200. Although the addition and subtraction computations were performed successfully without the availability of a calculator, calculators were provided for some parts of the assessment, as illustrated by the division problem shown below.²⁶

EXAMPLE: Level 200

Divide 108 by 9.

Answer: 12

Did you use the calculator on this question?

☒ Yes

☐ No

Grade 8: --

* The standard errors of the estimated percentages appear in parentheses.
-- Insufficient number of respondents at Level 200.

²⁶In 1992, there were 13 sections of mathematics questions in the assessment at each grade level and the estimation section. Students at grades 4 and 8 were given calculators to use on three of the 13 sections; at grade 12, calculators were available for four of these sections. The test administrator provided students with instructions and practice on how to use the calculator prior to the assessment. During the assessment, students receiving calculator sections were allowed to choose whether or not to use the calculator for each item in the section, and they were asked to indicate in their test booklets whether they did or did not use it for each item.

EXAMPLE: Level 200

There are 50 hamburgers to serve 38 children. If each child is to have at least one hamburger, at most how many of the children can have more than one?

* The standard errors of the estimated percentages appear in parentheses.
-- Insufficient number of respondents at Level 200.

Level 250

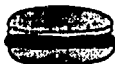

Multiplication and Division, Simple
Measurement, and Two-Step Problem Solving

Performance at Level 250 was typified by some facility with all four operations in solving various two-step word problems involving whole numbers. Students at this level also seemed familiar with using a ruler, and showed some knowledge of common geometric shapes. They completed a variety of bar graphs and pictographs, and showed some degree of success with problems involving simple number patterns, as well as the ideas of variable and probability.

For the nation, performance at this level improved for fourth graders between 1990 and 1992, from an estimated 12 to 17 percent. About two-thirds of the eighth graders and 90 percent of the twelfth graders were estimated to have performed at this level in both assessments. For the jurisdictions participating in the Trial State Assessments, there was quite a range in the estimated percentages of fourth graders reaching this level -- from 4 to 26 percent. Those having 10 percent or fewer fourth graders estimated to be at or above Level 250 included Alabama, Arkansas, the District of Columbia, Louisiana, Mississippi, New Mexico, Tennessee, and Guam. Those with an estimated 20 percent or more of their fourth graders performing above this level included Connecticut, Iowa, Maine, Massachusetts, Minnesota, Nebraska, New Hampshire, New Jersey, North Dakota, Pennsylvania, and Wisconsin. At grade 8, the percentage of students attaining Level 250 was estimated to have ranged from 18 percent in the Virgin Islands, to about one-third in the District of Columbia and Guam, to about half in Alabama and Louisiana, to more than four-fifths in Iowa and North Dakota. Improvement between 1990 and 1992 was shown by more participating jurisdictions at this anchor level than at others. Ten states, including Colorado, the District of Columbia, Hawaii, Iowa, Kentucky, Minnesota, New Hampshire, New York, North Carolina, and Oklahoma, showed gains at Level 250.

The following set of questions is illustrative of performance at Level 250 and demonstrates students' ability to work with whole numbers in several different simple settings, including from a table or reading a scale.

EXAMPLE: Level 250

			
Cheeseburger 393 Calories	Hot Dog 298 Calories	Yogurt 214 Calories	Cookie 119 Calories

Which two of the items above would provide a total of about 600 calories?

Level 300

Reasoning and Problem Solving Involving
Fractions, Decimals, Percents and
Elementary Concepts in Geometry,
Statistics, and Algebra

Students performing at or above Level 300 demonstrated some reasoning ability in a variety of problem situations, including some that involved fractions, decimals, or percents. They also showed beginning understandings of concepts in geometry, statistics, and algebra. Probably because some of the concepts and skills typifying Level 300 occur in the curriculum after fourth grade, only a handful of fourth graders were estimated to have reached this level across the nation. The state results were similar; half a percent or fewer fourth graders were estimated to have attained this level in most jurisdictions, except in Connecticut, Maine, and Virginia, where 1 percent of the fourth graders were estimated to be at or above Level 300.

In 1992, it was estimated that 20 percent of the eighth graders and 50 percent of the twelfth graders nationally performed at or above Level 300. This represented an increase compared to 1990, when approximately 15 percent and 45 percent reached this level at grades 8 and 12, respectively. Of the participating states, Colorado, Iowa, Minnesota, New York, North Carolina, and Texas showed increases in the percentage of eighth graders performing at or above Level 300. Still, in 1992 the estimated percentages of students at grade 8 reaching this level ranged from 1 to 29, with the majority of the participants having fewer than one-fourth of their students reach this level on the scale.

The first set of questions shown below illustrates some increased understanding in the area of numbers and operations by students performing at or above Level 300 as compared to students performing at lower levels on the scale. For example, several of these problems involve fractions or multiple steps, and one involves calculating a percentage.

EXAMPLE: Level 300

Jill needs to earn \$45.00 for a class trip. She earns \$2.00 each day on Mondays, Tuesdays, and Wednesdays, and \$3.00 each day on Thursdays, Fridays, and Saturdays. She does not work on Sundays. How many weeks will it take her to earn \$45.00 ?

Level 350

Reasoning and Problem Solving Involving Geometric Relationships, Algebra, and Functions

Students performing at or above Level 350 have extended their understanding of mathematics to include some specialized content, such as functional notation, rectangular coordinates, and linear equations. However, it was estimated that very few students -- 6 percent of the high-school seniors and 1 percent of the eighth graders -- attained this level. Further, these figures represent essentially no change from performance in 1990.

Participating jurisdictions also showed similar performance between 1992 and 1990, with at most an estimated 1 percent of the eighth graders in some of the states performing at or above Level 350 in either assessment.

The first set of illustrative items for Level 350 is indicative of the highest-performing students' understanding of geometric figures, properties, and relationships.

Example: Level 350

The area of rectangle $BCDE$ shown above is 60 square inches. If the length of AE is 10 inches and the length of ED is 15 inches, what is the area of trapezoid $ABCD$, in square inches?

* The standard errors of the estimated percentages appear in parentheses.
-- Insufficient number of respondents at Level 350.

EXAMPLE: Level 350

Overall Percent Correct*

Grade 12: 32(1.4)

Conditional-Level 350

Grade 12: 79%

In the xy -plane, a line parallel to the x -axis intersects the y -axis at the point $(0, 4)$. This line also intersects a circle in two points. The circle has a radius of 5 and its center is at the origin. What are the coordinates of the two points of intersection?

- A $(1, 2)$ and $(2, 1)$
- B $(2, 1)$ and $(2, -1)$
- C $(3, 4)$ and $(3, -4)$
- ☒ D $(3, 4)$ and $(-3, 4)$
- E $(5, 0)$ and $(-5, 0)$

Did you use the calculator on this question?

☐ Yes

☒ No

* The standard errors of the estimated percentages appear in parentheses.

EXAMPLE: Level 350

Overall Percent Correct*

Grade 12: 29(1.5)

Conditional-Level 350

Grade 12: 92%

In the figure above, point Q is fixed and point P starts at 4 and moves left along the x -axis. As P moves left along the x -axis toward O , the area of $\triangle POQ$ changes.

Use the information given to complete the table below to show how the area of $\triangle POQ$ changes as P goes from the position shown to the origin O .

x - coordinate of P	Area of $\triangle POQ$
4	12
3	9
2	6
1	3
0	0

* The standard errors of the estimated percentages appear in parentheses.

The three questions shown below exemplify some of the algebra and functions concepts that students performing at or above Level 350 appear to understand.

EXAMPLE: Level 350

If $f(x) = 4x^2 - 7x + 5.7$, what is the value of $f(3.5)$?

Answer: 30.2

Did you use the calculator on this question?

☒ Yes

No

Overall Percent Correct*

Grade 12: 39(1.6)

Conditional-Level 350

Grade 12: 90%

EXAMPLE: Level 350

For what value of x is $8^{12} = 16^x$?

A 3

B 4

C 8

☒ D 9

E 12

Did you use the calculator on this question?

☒ Yes

No

Overall Percent Correct*

Grade 12: 34(1.5)

Conditional-Level 350

Grade 12: 83%

* The standard errors of the estimated percentages appear in parentheses.

EXAMPLE: Level 350

Overall Percent Correct*

Grade 12: 20(1.3)

Conditional-Level 350

Grade 12: 60%

The figure above shows the graph of $y = f(x)$. Which of the following could be the graph of $y = |f(x)|$?

A

B

C

D

E

* The standard errors of the estimated percentages appear in parentheses.

Anchor-Level Results by Region

Across the regions, the anchor-level results show very little statistically significant change between 1992 and 1990 at any grade or particular level of performance, with the exception of a greater percentage of eighth-grade students estimated to have performed at or above Level 300 in the Central region (see TABLE A.3). The significant improvements in average proficiency shown for some regions at some grades appear to be reflected in slight, but not statistically significant, increases at several of the anchor levels.

TABLE A.3 Average Mathematics Proficiency and Anchor Levels by Region, Grades 4, 8, and 12

	Assessment Years	Percent of Students	Average Proficiency	Percentage of Students At or Above			
				Level 200	Level 250	Level 300	Level 350

	1990	29(1.2)	294(2.6)	100(0.4)	88(1.4)	45(3.2)	6(1.4)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

Anchor Level Results by Race/Ethnicity

The anchor level results by race/ethnicity are presented for the nation in TABLE A.4 and for the states in TABLE A.5. In general, for the nation and the states, the data parallel those discussed earlier in the body of this report. Greater percentages of White and Asian/Pacific Islander students were estimated to have reached higher anchor levels on the scale than did their Black, Hispanic, and American Indian counterparts. This pattern did not change between the two assessments. The average proficiency of White students improved at all three grade levels assessed, and these increases were accompanied by greater percentages of fourth graders performing at Levels 200 and 250 as well as greater percentages of eighth and twelfth graders performing at Levels 250 and 300. Although Black and Hispanic twelfth graders also showed significant improvement in their average achievement, the apparent increases noted at Levels 200 and 250 were not statistically significant.

Within the states, in both 1992 and 1990, the relative standing of the racial/ethnic groups tended to parallel that of the nation, although in a number of states, greater percentages of Asian/Pacific Islander students reached higher anchor levels than did their White counterparts. At grade 8, more gains were shown between 1990 and 1992 by White students across the anchor levels than by their counterparts of other racial/ethnic backgrounds, although in some states there were too few respondents in particular race/ethnicity classifications to estimate proficiency accurately and, because of the sample sizes, certain differences were not statistically significant.²⁷ White students showed improvement at Level 250 in Connecticut, Florida, Iowa, Michigan, New Hampshire, and Rhode Island; and at Level 300 in Connecticut, Florida, and Minnesota. Black students in the District of Columbia showed gains at Level 250. In Hawaii, Asian/Pacific Islander students had increased performance at both Levels 200 and 250. At Level 250, American Indian students showed improvements in Arizona and North Dakota, although in the latter case the results may be less stable.

²⁷For results to be reported for any subgroup, a minimum sample size of 62 students was required (see Appendix D for details).

TABLE A.4 Average Mathematics Proficiency and Anchor Levels by Race/Ethnicity, Grades 4, 8, and 12

	Assessment Years	Percent of Students	Average Proficiency	Percentage of Students At or Above			
				Level 200	Level 250	Level 300	Level 350

TERRITORY										
Guam	58 (3.3)	32 (5.7)	26 (2.5)	42 (1.7)	*** (***)	10 (1.7)	2 (2.4)	2 (0.8)	4 (0.7)	*** (***)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

Anchor-Level Results by Gender

TABLES A.6 and A.7 contain the anchor-level results by gender for the nation and the states. For the nation, both genders showed significant increases in their average proficiency at all three grades assessed. However, males may have gained some advantage compared to females at grade four, since significantly increased percentages performed at or above Levels 200 and 250, while the apparent increases for females were not statistically significant. In contrast, females showed statistically significant improvement at grades 8 (Level 300) and 12 (Level 250), while the apparent increases by males were not statistically significant.

For the states, the anchor-level results indicate relatively comparable achievement between the genders. The trends for eighth graders indicate similar amounts of improvement across the genders. In Hawaii, the males improved at Level 200. At Level 250, males showed gains in Hawaii, North Carolina, and Rhode Island, while increased percentages of females were found in Arizona, Iowa, North Carolina, Rhode Island, and the Virgin Islands. Males in North Carolina and Texas as well as females in Iowa, Minnesota, and New York, showed gains at Level 300.

TABLE A.6 Average Mathematics Proficiency and Anchor Levels by Gender, Grades 4, 8, and 12

	Assessment Years	Percent of Students	Average Proficiency	Percentage of Students At or Above			
				Level 200	Level 250	Level 300	Level 350
<u>Grade 4</u>							
Male	1992	50(0.6)	220(0.8)>	73(1.0)>	18(1.0)>	0(0.2)	0(0.0)
	1990	52(1.0)	214(1.2)	68(1.8)	13(1.4)	0(0.2)	0(0.0)
Female	1992	50(0.6)	217(1.0)>	72(1.2)	15(1.1)	0(0.2)	0(0.0)
	1990	48(1.0)	212(1.1)	67(1.9)	12(1.2)	0(0.0)	0(0.0)
<u>Grade 8</u>							
Male	1992	51(0.6)	267(1.1)>	96(0.6)	68(1.2)	20(1.2)	1(0.2)
	1990	51(1.0)	263(1.6)	95(0.9)	65(1.9)	16(1.4)	1(0.4)
Female	1992	49(0.6)	268(1.0)>	97(0.4)	69(1.2)	19(1.1)>	1(0.2)
	1990	49(1.0)	262(1.3)	96(0.8)	65(1.5)	13(1.0)	0(0.1)
<u>Grade 12</u>							
Male	1992	49(0.8)	301(1.1)>	100(0.1)	92(0.7)	52(1.5)	8(0.6)
	1990	48(1.0)	297(1.4)	100(0.2)	89(1.2)	47(1.8)	7(1.2)
Female	1992	51(0.8)	297(1.0)>	100(0.1)	91(0.7)>	48(1.3)	5(0.7)
	1990	52(1.0)	292(1.3)	99(0.3)	87(1.3)	43(1.9)	3(0.6)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

(xxx) Did not participate in the 1990 Trial State Assessment.

Anchor-Level Results by Type of Community

The anchor-level results for students attending schools in different types of communities are presented for the nation in TABLE A.8 and by state in TABLE A.9. The pattern across the data shows greater percentages of students in advantaged urban schools reaching higher anchor levels on the scale than their counterparts in disadvantaged urban schools. Students attending schools in extreme rural communities tended to have achievement between that of the two urban groups, although in some states they performed as well as the students in advantaged urban schools.

The trends between the two assessments indicate little change in the relative standing of these groups. Statistically significant changes in results for the anchor levels by type of community were relatively rare across the states and territories. Advantaged urban students showed gains at Levels 250 and 300 in New Hampshire and at Level 300 in Texas. In Hawaii, fewer advantaged urban students performed at or above Level 300 in 1992 than in 1990. The only increase for disadvantaged urban students was found in Oklahoma at Level 250. Students attending schools in extreme rural communities improved in Louisiana at both Levels 200 and 250 and in Iowa at Level 250. In Guam, particularly at or above Level 250, but also for Level 300, lower percentages of students were found in 1992 than in 1990. Students attending schools in other types of communities showed improvement in Rhode Island at Level 200, in Connecticut, the District of Columbia, Hawaii, Nebraska, North Carolina, Rhode Island, and Guam at Level 250 as well as in Colorado, Connecticut, the District of Columbia, New Jersey, Pennsylvania, and Guam at Level 300.

	1990	71(4.4)	295(1.3)	100(0.2)	89(1.1)	46(1.7)	5(0.9)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

Guam	*** (***)	*** (***)	30 (3.3)	45 (1.5)	*** (***)	*** (***)	2 (0.8)	5 (0.7)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students. ! Interpret with caution - the nature of the sample does not allow accurate determination of the variability of this estimated statistic.

^{>>}The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. ^{<<}The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then [>] and [<] also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

Anchor-Level Results by Parents' Highest Level of Education

The national anchor-level results by parents' highest level of education indicate that the more educated the students' parents, the greater the percentage likely to perform at higher anchor levels on the scale (TABLE A.10). Also, students with parents who have graduated from college showed increased average performance between 1990 and 1992 at all three grade levels. One of the few statistically significant improvements at an anchor level was for these students at grade 8 for Level 300; the other two were at Levels 200 and 250 for fourth graders who did not know their parents' educational background.

For the states, the pattern was less clear (TABLE A.11). For many jurisdictions there was little difference in performance between those students whose parents had some education after high school and those whose parents had graduated from college, or between those whose parents had or had not graduated from high school. However, greater percentages of the former group (those with parents educated beyond high school) tended to perform at successively higher anchor levels than did the latter group (high-school education or less).

The trends across jurisdictions participating in both the 1992 and 1990 assessments at grade 8 reveal few changes. The several places showing gains were all for students whose parents had graduated from college: the District of Columbia at Level 250, and Iowa and Colorado at Level 300.

I Don't Know	1992	3(0.6)	276(3.0)	99(1.6)	77(4.5)	25(4.8)	1(1.9)
	1990	2(0.3)	268(4.9)	96(3.7)	71(7.6)	19(4.6)	1(0.9)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

TERRITORY										
Guam	40 (2.1)	60 (4.5)	35 (4.1)	29 (5.2)	41 (1.9)	4 (1.0)	13 (3.4)	2 (1.2)	3 (2.4)	4 (0.7)

The standard errors of the estimated percentages appear in parentheses. It can be said with 95 percent certainty that for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. ***Sample size insufficient to permit reliable estimate. There were fewer than 62 students.

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. > The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages less than 0.5 percent were rounded to 0 percent. (xxx) Did not participate in the 1990 Trial State Assessment.

Anchor-Level Results by Type of School

The anchor-level results for students attending public schools, Catholic schools, and other types of private schools (non-Catholic) are presented in TABLE A.12. In 1992, greater percentages of Catholic-school eighth graders, as well as those attending non-Catholic private schools, reached Levels 250 and 300 than their public-school counterparts. Similar results occurred at grade 12 for Level 300.

With the exception of fourth graders attending other private schools, these data reveal a general pattern of apparent improvement between 1990 and 1992 for students attending all types of schools across the grades and anchor levels. Statistically significant increases were noted for fourth graders attending public schools for Levels 200 and 250, for eighth graders attending all three types of schools for Level 300, and for twelfth graders attending public schools at Level 250 and attending other private schools for Levels 300 and 350.

TABLE A.12 Average Mathematics Proficiency and Anchor Levels by Type of School, Grades 4, 8, and 12

	Assessment Years	Percent of Students	Average Proficiency	Percentage of Students At or Above			
				Level 200	Level 250	Level 300	Level 350
<u>Grade 4</u>

	1990	4(1.4)	298(5.1)!	100(0.0)	95(1.9)	49(7.5)	5(2.9)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

Anchor-Level Results by School Performance

To examine the relationship between level of school performance and level of student performance, NAEP sorted schools by their students' average proficiency on the mathematics assessment, identifying the top one-third and bottom one-third of the schools. TABLE A.13 shows the anchor-level results for students in the top and the bottom one-third of the schools in the nation.

As would be expected from how the groups were formed, students in the top one-third performing public and private schools had higher mathematics proficiency than did those in the lower-performing schools in both assessments. Further, this disparity tended to increase for the nation between 1990 and 1992, because the students attending better-performing schools showed generally more improvement than those attending the poorer-performing schools.

For students attending the top one-third schools, the increase in average proficiency at all three grades was reflected in greater percentages reaching Levels 200 and 250 at grade 4 and Levels 250 and 300 at both grades 8 and 12. Despite an increase in average proficiency at grade 12, for students attending the bottom one-third performing schools, none of the seeming increases at any of the anchor levels were statistically significant. In fact, in 1992, greater percentages of eighth graders in the better-performing schools reached Levels 250 and 300 than did twelfth graders in the poorer-performing schools.

The results for states and territories by school performance are presented in TABLES A.14 and A.15. A similar pattern prevails. In general, it was estimated that about one-fifth to one-third of the fourth graders in the top one-third performing schools attained Level 250 in comparison to 15 percent or fewer in the bottom one-third performing schools. At grade 8, in 1992, there was a great range in the percentage of students in the better performing schools estimated to be at or above Level 300 -- from 1 to 44 percent. The range was smaller for students attending the poorer performing schools -- estimated to be from 0 to 20 percent.

The trends between 1990 and 1992 show increased percentages of students in the upper one-third performing schools reaching Level 200 in Hawaii and at Level 300 in Colorado, Minnesota, New York, and Texas. For students in the lower one-third performing schools, gains were found at Level 250 in Hawaii, New Hampshire, North Carolina, and Oklahoma as well as at Level 300 in Hawaii and Minnesota.

TABLE A.13 Average Mathematics Proficiency and Anchor Levels for the Top One-Third of the Schools and the Bottom One-Third of the Schools, Grades 4, 8, and 12

	Assessment Years	Percent of Students	Average Proficiency	Percentage of Students At or Above			
				Level 200	Level 250	Level 300	Level 350
<u>Grades 4</u>							
Top One-Third Schools	1992	34(2.8)	237(0.8)>	92(0.8)>	31(1.3)>	1(0.3)	0(0.0)
	1990	34(3.9)	229(1.4)	87(1.2)	23(2.6)	0(0.3)	0(0.0)
Bottom One-Third Schools	1992	29(2.1)	196(1.2)	46(2.0)	3(0.5)	0(0.0)	0(0.0)
	1990	30(3.4)	194(1.7)	42(2.5)	4(0.8)	0(0.0)	0(0.0)
<u>Grades 8</u>							
Top One-Third Schools	1992	29(3.1)	289(1.3)>	100(0.3)	90(1.1)>	37(1.8)>	2(0.5)
	1990	30(4.4)	280(1.2)	99(0.5)	83(1.5)	27(2.6)	1(0.8)
Bottom One-Third Schools	1992	32(1.8)	245(0.9)	92(1.1)	43(1.3)	5(0.6)	0(0.1)
	1990	34(3.9)	244(1.8)	89(1.7)	43(1.8)	6(0.9)	0(0.1)
<u>Grades 12</u>							
Top One-Third Schools	1992	35(3.1)	316(1.1)>	100(0.1)	98(0.4)>	71(1.5)>	13(1.0)
	1990	34(5.0)	310(1.2)	100(0.1)	95(0.9)	63(1.6)	11(1.9)
Bottom One-Third Schools	1992	27(2.2)	279(1.0)>	100(0.3)	81(1.3)	26(1.6)	1(0.3)
	1990	26(3.3)	274(1.5)	99(0.6)	78(2.1)	21(1.9)	1(0.3)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 95 percent confidence level. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details). When the proportion of students is either 0 percent or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent and percentages 0.5 percent or less were rounded to 0 percent.

Guam	37 (0.2)	180 (1.5)	28 (2.3)	2 (0.6)	0 (0.1)	0 (0.0)

The standard errors of the estimate for the population of interest, the value for the proportion of students is either 0 or 100 percent and percentages less than 0.5 percent were rounded to 0 percent. Interpret with caution - the nature of the sample does not allow accurate determination.

Percentages and proficiencies appear in parentheses. It can be said with 95 percent certainty that for each whole population is within plus or minus two standard errors of the estimate for the sample. When the proportion is 0 or 100 percent, the standard error is inestimable. However, percentages 99.5 percent and greater were rounded to 100 percent. Interpret with caution - the nature of the sample does not allow accurate determination.

>>The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. <<The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated. (xxx) Did not participate in the 1990 Trial State Assessment.

(xxx) Did not participate in the 1990 Trial State Assessment.

Summary

The anchor-level results indicate that more fourth graders in 1992 than in 1990 could compute and solve simple word problems involving whole numbers (Levels 200 and 250). The percentage estimated to have demonstrated success with problems involving addition and subtraction increased from 67 to 72 percent, and the percentage showing some understanding of all four operations and success in solving problems in two-step situations increased from 12 to 17 percent.

At grade 8, students showed particular improvement at Level 300, typified by an understanding of fractions, decimals, and percents as well as beginning concepts in geometry, statistics, and algebra. The percentage estimated to be at or above this level rose from 15 to 20 percent. However, the percentage showing less mathematical understanding (Level 250 -- whole number addition, subtraction, multiplication, and division) was estimated to have remained at about two-thirds, and few showed any sophistication with geometry or algebra (Level 350).

Twelfth graders improved their performance in the mid-ranges of the scale, but not at the upper end. The already substantial proportion demonstrating a grasp of the four operations with whole numbers (Level 250) was estimated to have increased from 88 to 91 percent, and the percentage showing some mathematical understanding beyond operations with whole numbers rose from an estimated 45 to 50 percent. Yet, the percentage estimated to have shown any depth of mathematical sophistication remained virtually the same -- 6 percent.

At grade 4, the results for the various participating jurisdictions tended to parallel the national results, within some reasonable bounds of variation for the higher- and lower-performing entities. At grade 8, however, there was considerable range of performance across the participants. For example, it was estimated that more than one-fourth of the eighth graders in Iowa, Minnesota, North Dakota, and Wisconsin performed at or above Level 300. In contrast, fewer than 10 percent were estimated to have done so in Alabama, Arkansas, the District of Columbia, Louisiana, Mississippi, West Virginia, Guam, and the Virgin Islands.

For jurisdictions participating in both the 1992 and 1990 eighth-grade assessments, a number of increases were found across anchor levels. North Carolina showed gains at three levels: 200, 250, and 300. Several other states showed improvements at two levels, including Hawaii and Rhode Island at

Levels 200 and 250 as well as Colorado, Iowa, and Minnesota at Levels 250 and 300. Additionally, the District of Columbia, Kentucky, New Hampshire, and Oklahoma showed gains at Level 250, while New York and Texas improved at Level 300.

Despite the general pattern of improvement between the 1990 and 1992 assessments, the national results across demographic groups indicated that a number of large disparities persist, particularly between Asian/Pacific Islander and White students as compared to their American Indian, Black, and Hispanic counterparts, between students attending advantaged urban schools and those attending disadvantaged urban schools, and between students attending public and private schools at grades 8 and 12. Most striking was the discrepancy between performance for students in the top-performing one-third of the schools as compared to those in the bottom-performing one-third of the schools. In 1992, high-school seniors in the bottom one-third performing schools appeared to be less mathematically proficient than eighth graders in the top one-third performing schools. It was estimated that only about one-fourth of these students, about to graduate from high school, showed a consistent grasp of mathematics that included fractions, decimals, and percents as well as elementary concepts in geometry, statistics, and algebra.

APPENDIX B

Guidelines for Sample Participation and Explanation of Derivation of Weighted Participation

Introduction

Since 1989, state representatives, the National Assessment Governing Board (NAGB), several committees of external advisors to the National Assessment of Educational Progress (NAEP), and the National Center for Education Statistics (NCES) have engaged in numerous discussions about the procedures for reporting the NAEP Trial State Assessment results. As part of these discussions, it was recognized that sample participation rates across the states and territories have to be uniformly high to permit fair and valid comparisons. Therefore, NCES established four guidelines for school and student participation in the 1990 Trial State Assessment Program.

The participation rate data were presented in the appendix of the 1990 composite mathematics report (*The State of Mathematics Achievement*) and a notation was made in those appendix tables and in Table 2 of the appropriate state report for any jurisdiction with participation levels that did not meet the guidelines. Virtually every state and territory met or exceeded the four guidelines for the 1990 program.

For the 1992 Trial State Assessment, NCES has decided to continue to use those four guidelines, two relating to school participation and two relating to student participation. The guidelines are based on the standards for sample surveys that are set forth in the U.S. Department of Education's *Standards and Policies* (1987). Three of the guidelines for the 1992 program are identical to those used in 1990, while one guideline for school participation has been modified.

NCES and NAGB have reviewed the policy of how participation rates can best be presented so that readers of reports can accurately assess the quality of

the data being reported. They have decided that for reporting the results from the 1992 Trial State Assessment Program, tables again will have notations for the jurisdictions not meeting each guideline. They also have decided that there will be a fuller discussion in the body of the 1992 composite reports about the participation rates and nature of the samples for each of the participating jurisdictions.

The next section of this report provides an explanation of the guidelines and notations. In brief, the guidelines cover levels of school and student participation, both overall and for particular population classes. Consistent with the NCES standards, weighted data must be used to calculate all participation rates for sample surveys, and weighted rates will be provided in the reports. The procedures used to derive the weighted school and student participation rates are provided immediately after the discussion of the guidelines and notations.

The final section of this appendix consists of a set of tables that provide the participation rate information for the 1992 Trial State mathematics assessment. Because the aggregate across all states is not representative of any meaningful sample, the weighted participation rates across states have not been analyzed. However, the national and regional counts from the national assessment have been included and do provide some context for interpreting the summary of activities in each individual state and territory.

Notations for Use in Reporting School and Student Participation Rates

Unless the overall participation rate is high for a state or territory, there is a risk that the assessment results for that jurisdiction are subject to appreciable nonresponse bias. Moreover, even if the overall participation rate is high, there may be significant nonresponse bias if the nonparticipation that does occur is heavily concentrated among certain classes of schools or students.

The following notations concerning school and student participation rates in the Trial State Assessment Program were established to address four significant ways in which nonresponse bias could be introduced into the jurisdiction sample estimates. The four conditions that will result in a state or territory receiving a notation in the 1992 reports are presented below. Note that in order to receive no notations, a state or territory must satisfy all the guidelines at both grade 4 and grade 8.

A jurisdiction will receive a notation if:

1. Both the state's weighted participation rate for the initial sample of schools was below 85 percent AND the weighted school participation rate after substitution was below 90 percent; OR the weighted school participation rate of the initial sample of schools was below 70 percent (regardless of the participation rate after substitution.)

Discussion: For states or territories that did not use substitute schools, the participation rates are based on participating schools from the original sample. In these situations, the NCES standards specify weighted school participation rates of at least 85 percent to guard against potential bias due to school nonresponse. Thus, the first part of the notation that refers to the weighted school participation rate for the initial sample of schools is in direct accordance with NCES standards.

To help ensure adequate sample representation for each jurisdiction participating in the 1992 Trial State Assessment Program, NAEP provided substitutes for nonparticipating schools. When possible, a substitute school was provided for each initially selected school that declined participation before November 15, 1991. For states or territories that used substitute schools, the assessment results will be based on the student data from all participating schools from both the original sample and the list of substitutes (unless both an initial school and its substitute eventually participated, in which case only the data from the initial school will be used).

The NCES standards do not explicitly address the use of substitute schools to replace initially selected schools that decide not to participate in the assessment. However, considerable technical consideration was given to this issue. Even though the characteristics of the substitute schools were matched as closely as possible to the characteristics of the initially selected schools, substitution does not entirely eliminate bias due to the nonparticipation of initially selected schools. Thus, for the weighted school participation rates including substitute schools, the guideline was set at 90 percent.

Finally, if the jurisdiction's school participation rate for the initial sample of schools is below 70 percent, even if the rate after substitution exceeds 90 percent, there is a substantial possibility that, in aggregate, the substitute schools are not sufficiently similar to the schools that they replaced to assure that there is negligible bias in the assessment results. The last part of the notation takes this into consideration.

A jurisdiction will receive a notation if:

2. The nonparticipating schools included a class of schools with similar characteristics, which together accounted for more than five percent of the state's total fourth- or eighth-grade weighted sample of public schools. The classes of schools from each of which a state needed minimum school participation levels were determined by urbanicity, minority enrollment, and median household income of the area in which the school is located.

Discussion: The NCES standards specify that attention should be given to the representativeness of the sample coverage. Thus, if some important segment of the jurisdiction's population is not adequately represented, it is of concern, regardless of the overall participation rate.

This notation addresses the fact that, if nonparticipating schools are concentrated within a particular class of schools, the potential for substantial bias remains, even if the overall level of school participation appears to be satisfactory. Nonresponse adjustment cells have been formed within each jurisdiction, and the schools within each cell are similar with respect to minority enrollment, urbanicity, and/or median household income, as appropriate for each jurisdiction.

If more than five percent (weighted) of the sampled schools (after substitution) are nonparticipants from a single adjustment cell, then the potential for nonresponse bias is too great. This guideline is based on the NCES standard for stratum-specific school nonresponse rates.

A jurisdiction will receive a notation if:

3. The weighted student response rate within participating schools was below 85 percent.

Discussion: This guideline follows the NCES standard of 85 percent for overall student participation rates. The weighted student participation rate is based on all eligible students from initially selected or substitute schools who participated in the assessment in either an initial session or a make-up session. If the rate falls below 85 percent, then the potential for bias due to students' nonresponse is too great.

A jurisdiction will receive a notation if:

4. The nonresponding students within participating schools included a class of students with similar characteristics, who together comprised more than five percent of the state's weighted assessable student sample. Student groups from which a state needed minimum levels of participation were determined by age of student and type of assessment session (unmonitored or monitored), as well as school urbanicity, minority enrollment, and median household income of the area in which the school is located.

Discussion: This notation addresses the fact that if nonparticipating students are concentrated within a particular class of students, the potential for substantial bias remains, even if the overall student participation level appears to be satisfactory. Student nonresponse adjustment cells have been formed using the school-level nonresponse adjustment cells, together with the student's age and the nature of the assessment session (unmonitored or monitored). If more than five percent (weighted) of the invited students who do not participate in the assessment are from a single adjustment cell, then the potential for nonresponse bias is too great. This guideline is based on the NCES standard for stratum-specific student nonresponse rates.

Derivation of Weighted Participation Rates

Weighted School Participation Rates. The weighted school participation rates within each state or territory provide the percentages of fourth- or eighth-grade students in public schools who are represented by the schools participating in the assessment, prior to statistical adjustments for school nonresponse.

Two weighted school participation rates are computed per subject per grade for each state and territory. The first is the weighted participation rate for the initial sample of schools. This rate is based only on those schools that were initially selected for the assessment. The numerator of this rate is the sum of the number of students represented by each initially selected school that participated in the assessment. The denominator is the sum of the number of students represented by each of the initially selected schools found to have eligible students enrolled. This includes both participating and nonparticipating schools.

The second participation rate is the weighted participation rate after substitution. The numerator of this rate is the sum of the number of students

represented by each of the participating schools, whether originally selected or a substitute. The denominator is the same as that for the weighted participation rate for the initial sample. This means that, for a given state, grade, and subject, the weighted participation rate after substitution is always at least as great as the weighted participation rate for the initial sample of schools.

In general, different schools in the sample can represent different numbers of students in the state population. The number of students represented by an initially selected school (the school weight) is the fourth- or eighth-grade enrollment of the school divided by the probability that the school was included in the sample. For instance, a selected school with an eighth-grade enrollment of 150 and a selection probability of 0.2 represents 750 students from that state. The number of students represented by a substitute school is the number of students represented by the replaced nonparticipating school.

Because each selected school represents different numbers of students in the population, the weighted school participation rates may differ somewhat from the simple unweighted rates. (The unweighted rates are calculated from the counts of school by dividing the number of participating schools by the number of schools in the sample.) The difference between the weighted and the unweighted rates is potentially largest in smaller jurisdictions where all schools with fourth- or eighth-grade students were included in the sample. In those jurisdictions, each school represents only its own students. Therefore, the nonparticipation of a large school reduces the weighted school participation rate by a greater amount than does the nonparticipation of a small school.

The nonparticipation of larger schools also has greater impact than that of smaller schools on reducing weighted school participation rates in larger jurisdictions where fewer than all of the schools were included in the sample. However, since the number of students represented by each school is more nearly constant in larger states, the difference between the impact of nonparticipation by either large or small schools is less marked than in states where all schools were selected.

In general, the larger the jurisdiction, the less the difference is between the weighted and unweighted school participation rates. However, even in the smaller jurisdictions, the differences tend to be small.

Weighted Student Participation Rate. The weighted student participation rate provides the percentage of the eligible student population from participating schools within the state or territory that are represented by the students who participated in the assessment (in either an initial session or a make-up session). The eligible student population from participating schools within a jurisdiction consists of all public-school students who were in the fourth grade or eighth grade, who attended a school that, if selected, would have participated and who, if selected, would not have been excluded from the assessment. The numerator of this rate is the sum, across all assessed students, of the number of students represented by each assessed student (prior to adjustment for student nonparticipation). The denominator is the sum of the number of students represented by each selected student who was invited and eligible to participate (i.e., not excluded), including students who did not participate. Thus, the denominator is an estimate of the total number of assessable students in the group of schools within the jurisdiction that would have participated if selected.

The number of students represented by a single selected student (the student weight) is 1.0 divided by the overall probability that the student was selected for assessment. In general, the number of students from a jurisdiction's population that are represented by a sampled student is approximately constant across students. Consequently, there is little difference between the weighted student participation rate and the unweighted student participation rate.

Weighted Overall School and Student Participation Rate. An overall indicator of the effect of nonparticipation by both students and schools is given by the overall participation rate. This is calculated as the product of the weighted school participation rate (after substitution), and the weighted student participation rate. For jurisdictions having a high overall participation rate the potential is low for bias to be introduced through either school nonparticipation or student nonparticipation. This rate provides a summary measure that indicates the proportion of the jurisdiction's fourth- or eighth-grade student population that is directly represented by the final student sample. When the overall rate is high, the adjustments for nonresponse that are used in deriving the final survey weights are likely to be effective in maintaining nonresponse bias at a negligible level. Conversely, when the overall rate is relatively low there is a greater chance that a nonnegligible bias remains even after making such adjustments.

The overall rate is not used in establishing the guidelines/notations for school and student participation, since guidelines exist already covering school and student participation separately. The overall participation rate was not reported in 1990.

Derivation of Weighted Percentages for Excluded Students

Weighted Percentage of Excluded Students. The weighted percentage of excluded students estimates the percentage of the fourth- or eighth-grade population in the jurisdiction's public schools that are represented by the students who were excluded from the assessment, after accounting for school nonparticipation. The numerator is the sum, across all excluded students, of the number of students represented by each excluded student. The denominator is the sum of the number of students represented by each of the students who was sampled (and had not withdrawn from the school at the time of the assessment).

Weighted Percentage of Students with an Individualized Education Plan (IEP). The weighted percentage of IEP students estimates the percentage of the fourth- or eighth-grade population in the jurisdiction's public schools that are represented by the students who were classified as IEP, after accounting for school nonparticipation. The numerator is the sum, across all students classified as IEP, of the number of students represented by each IEP student. The denominator is the sum of the number of students represented by each of the students who was sampled (and had not withdrawn from the school at the time of the assessment).

Weighted Percentage of Excluded IEP Students. The weighted percentage of IEP students who were excluded estimates the percentage of students in the jurisdiction that are represented by those IEP students who were excluded from the assessment, after accounting for school nonparticipation. The numerator is the sum, across all students classified as IEP and excluded from the assessment, of the number of students represented by each excluded IEP student. The denominator is the sum of the number of students represented by each of the IEP students who was sampled (and had not withdrawn from the school at the time of the assessment).

Weighted Percentage of Limited English Proficiency (LEP) Students. The weighted percentage of LEP students estimates the percentage of the fourth- or eighth-grade population in the jurisdiction's public schools that are represented by the students who were classified as LEP, after accounting for school nonparticipation. The numerator is the sum, across all students classified as LEP, of the number of students represented by each LEP student. The denominator is the sum of the number of students represented by each of the students who was sampled (and had not withdrawn from the school at the time of the assessment).

Weighted Percentage of Excluded LEP Students. The weighted percentage of LEP students who were excluded estimates the percentage of students in the jurisdiction that are represented by those LEP students who were excluded from the assessment, after accounting for school nonparticipation.

See explanations of the notations and guidelines about sample representativeness and for the derivation of weighted participation. Weighted percentages for the nation and region are based on schools sampled for all subject areas assessed in 1990 (reading, science, and mathematics) or 1992 (mathematics, reading, and writing). However, based on the national sampling design, the rates shown also are the best estimates for the mathematics assessment. ¹ Both the state's weighted participation rate for the initial sample of schools was below 85% AND the weighted school participation rate after substitution was below 90%; OR the weighted school participation rate of the initial sample of schools was below 70% (regardless of the participation rate after substitution.) ² The nonparticipating schools included a class of schools with similar characteristics, which together accounted for more than five percent of the state's total fourth- or eighth-grade weighted sample of public schools. The classes of schools from each of which a state needed minimum school participation levels were determined by urbanicity, minority enrollment, and median household income of the area in which the school is located.

³The Trial State Assessment was based on all eligible schools. There was no sampling of schools. ⁴In one or more schools an assessment was conducted, but either the wrong materials were sent to the school(s) or the materials were lost in shipping via the U.S. Postal Service. The school(s) are included in the counts of participating schools, both before and after substitution. However, in the weighted results, the school(s) are treated in the same manner as a nonparticipating school because no student responses were available for analysis and reporting.

³One or more schools in the original sample initially declined and then decided to participate after their substitute(s) had also agreed to participate. Further, assessments were conducted in both the original and substitute schools. For these cases the substitute school is included in the number of substitute schools provided and in the number of substitute schools participating. The state's estimates will be based on the student responses from the original school only. (xxx) Did not participate in the 1990 Trial State Assessment.

See explanations of the notations and guidelines about sample representativeness and for the derivation of weighted participation. Weighted percentages for the nation and region are based on schools sampled for all subject areas assessed in 1990 (reading, science, and mathematics) or 1992 (mathematics, reading, and writing). However, based on the national sampling design, the rates shown also are the best estimates for the mathematics assessment. ¹The weighted student response rate within participating schools was below 85 percent. Oklahoma, however, was the only state that required parental permission forms on a statewide basis. ²The nonresponding students within participating schools included a class of students with similar characteristics, who together comprised more than five percent of the state's weighted assessable student sample. Student groups from which a state needed minimum levels of participation were determined by age of student and type of assessment session (unmonitored or monitored), as well as school urbanicity, minority enrollment, and median household income of the area in which the school is located.

See explanations of the notations and guidelines about sample representativeness and for the derivation of weighted participation. Weighted percentages for the nation and region are based on schools sampled for all subject areas assessed in 1990 (reading, science, and mathematics) or 1992 (mathematics, reading, and writing). However, based on the national sampling design, the rates shown also are the best estimates for the mathematics assessment. **Notation Number 1** = Both the state's weighted participation rate for the initial sample of schools was below 85% AND the weighted school participation rate after substitution was below 90%; OR the weighted school participation rate of the initial sample of schools was below 70% (regardless of the participation rate after substitution.) **Notation number 3** = The weighted student response rate within participating schools was below 85 percent.

IEP = Individual Education Plan and LEP = Limited English Proficiency. To be excluded, a student was supposed to be IEP or LEP and judged incapable of participating in the assessment. A student reported as both IEP and LEP is counted once in the overall rate (first column), once in the overall excluded rate (second column), and separately in the remaining columns. Note: Weighted percentages for the nation and region are based on students sampled for all subject areas assessed in 1990 (reading, science, and mathematics) or 1992 (mathematics, reading, and writing). However, based on the national sampling design, the rates shown also are the best estimates for the mathematics assessment.

The Mathematics Teacher Questionnaire requested background information about the teacher (Part I) and information about instruction in particular classes (Part II). The percentage of students matched to questionnaires is provided for Part II. If they differed, the match rates for Part I were higher. Note: For the nation and regions, the percentage of excluded student questionnaires returned is based on students sampled for all subjects assessed in 1990 (reading, science, and mathematics) or 1992 (mathematics, reading, and writing). However, based on the sampling design, these rates also are the best estimates of the comparable rates for the mathematics assessment in each year.

APPENDIX C

State Contextual Background Factors: Summary of Students' Characteristics by Race/Ethnicity and Type of Community and Co-Statistics From Sources External to NAEP

Introduction

Appendix C presents a summary of student characteristics by race/ethnicity and type of community on a state-by-state level. To supplement the NAEP data, co-statistics have been compiled from sources external to NAEP. The statistics provide a comprehensive overview of demographic characteristics for each state, with an emphasis on the school systems. With data ranging from pupil-teacher ratios to the percentage of schools offering free lunches, Appendix C examines many of the external factors which may affect student performance.

*The value for 1992 was significantly higher than the value for 1990 at about the 95 percent certainty level. *The value for 1992 was significantly lower than the value for 1990 at about the 95 percent certainty level. These notations indicate statistical significance from a multiple comparison procedure based on the 37 jurisdictions participating in both 1992 and 1990. If looking at only one state, then > and < also indicate differences that are significant. Statistically significant differences between 1990 and 1992 for the state comparison samples for the nation and regions are not indicated.

APPENDIX D

Overview of Procedures Used in the 1992 Mathematics Assessments

Introduction

This appendix provides further information about the methods and procedures used in NAEP's 1992 mathematics assessment. The forthcoming *NAEP 1992 Technical Report* and the *Technical Report for the 1992 Mathematics Trial State Assessment* provide more extensive information about procedures.

NAEP's 1992 Mathematics Assessment

As described earlier in the report, the framework underlying NAEP's 1992 mathematics assessment was initially developed for the 1990 assessment and subsequently approved for use in both assessments by the National Assessment Governing Board. It was developed through a consensus process managed by the Council of Chief State School Officers, and the items were developed through a similarly broad-based process managed by Educational Testing Service. The development of the mathematics assessments, including the Trial State Assessment Program, benefited from the involvement of hundreds of representatives from State Education Agencies who attended numerous NETWORK meetings; served on committees; reviewed the framework, objectives, and questions; and in general, provided important suggestions on all aspects of the program.

The mathematics assessment framework is a five-by-three matrix specifying five content areas -- Numbers and Operations; Measurement; Geometry; Data Analysis, Statistics, and Probability; and Algebra and Functions, plus three process or ability areas. These include Conceptual Understanding,

Procedural Knowledge, and Problem Solving (for brief descriptions, see Chapter Three).²⁵ TABLES D.1 and D.2 show the approximate percentage distribution of questions by content area, mathematical ability, and grade.

TABLE D.1 Percentage Distribution of Questions by Grade and Content Area

Content Area	Grade 4	Grade 8	Grade 12
Numbers and Operations	45	30	25
Measurement	20	15	15
Geometry	15	20	20
Data Analysis, Statistics, and Probability	10	15	15
Algebra and Functions	10	20	25

TABLE D.2 Percentage Distribution of Questions by Grade and Mathematical Ability

Mathematical Ability	Grade 4	Grade 8	Grade 12
Conceptual Understanding	40	40	40
Procedural Knowledge	30	30	30
Problem Solving	30	30	30

Including all types of questions, the 1992 mathematics assessment for both the nation and states included 183 items at grade 4, 235 items at grade 8, and 231 items at grade 12. At grade 4, 59 of the questions required students to construct brief answers and 5 required lengthier explanations of the reasoning used. There were 99 multiple-choice questions as part of the main portion of the assessment and another 20 comprised the estimation portion of the assessment, which was administered via a paced audiotape timed to encourage students to estimate rather than "work out" their answers. At grade 8, there were 65 regular constructed-response questions and 6 requiring extended work. There also were 118 regular multiple-choice questions and 46 estimation multiple-choice questions. The twelfth-grade assessment contained 64 regular constructed-response questions, 6 extended constructed-response questions, 115 regular multiple-choice questions, and 46 estimation multiple-choice questions.

²⁵*Mathematics Objectives, 1990 Assessment* (Princeton, NJ: National Assessment of Educational Progress, Educational Testing Service, 1988).

The Assessment Design

Each student received a booklet containing a set of general background questions, a set of subject-specific background questions, three 15-minute segments or blocks of cognitive items, and a set of questions about his or her motivation and familiarity with the assessment material. At each grade level, the mathematics assessment included 16 different blocks of multiple-choice and constructed-response content questions. Students received different blocks of cognitive items in their booklets according to a careful plan. The 1992 assessment was based on an adaptation of matrix sampling called balanced incomplete block (BIB) spiraling -- a design that enables broad coverage of mathematics content while minimizing the burden for any one student. The balanced incomplete block part of the design assigns blocks of items to booklets and each pair of blocks appears together in at least one booklet. The spiraling part of the method cycles the booklets for administration, so that typically only a few students in any assessment session receive the same booklet.

Thirteen of the 16 blocks were assembled in accordance with this design, whereby the 13 blocks were presented in 26 booklets. Each block appeared in exactly six booklets, and each block appeared with every other block in at least one booklet. Students at grades 4 and 8 were given calculators to use with three of the 13 blocks and were trained in their use prior to the assessment. Students at grade 12 were given calculators to use with four of the 13 blocks. At the fourth grade, students were provided with four-function calculators and at grades 8 and 12, they were provided with scientific calculators. For another of the blocks, fourth-grade students were provided with a ruler, and eighth- and twelfth-grade students with a protractor/ruler. For still another of the blocks, at all three grades, students were given geometric shapes (manipulatives) to provide a concrete basis for determining their answers.

For the national assessment, the three remaining blocks at each grade used a paced-audiotape format to measure students' estimation skills and to move students through some word problems at grade 4 as well as material measuring data analysis, probability, and statistics and pre-algebra at the two upper grades. For the estimation block, the pacing method curtails time for computations and in more complex problem situations, it facilitates instances where students might have difficulty in reading the question or might spend too little or too much time on particular questions. The three blocks accompanied by the audiotape were assembled into one booklet at each grade. Of the 16 blocks, five were carried

forward from 1990 to use in measuring trends across time, including four of the 13 BIB spiraled blocks and the estimation block.

The Trial State Assessments at grades 4 and 8 used the same 26 BIB-spiraled booklets as the national assessment at each of the two grades, including the blocks with special materials -- calculators, protractor/rulers, and geometric shapes -- and the four trend blocks to monitor changes in eighth-grade performance. The students within an assessment session were assigned booklets in the order in which the booklets were spiraled. Thus, students in any given session received a variety of different booklets and only a small number of students in the session received the same booklet. Following this administration, all students at both grades were given a special booklet with the estimation block. This special booklet was administered using the same paced audiotope developed for the national assessment. However, since the estimation block was not included in the grade 8 1990 Trial State Assessment, state-level trends are not available on that block. In total, there were 14 blocks of mathematics questions in the 1992 Trial State Assessment, which was twice the size of the 1990 program. The additional scope provided time for a greater number of, and more challenging constructed-response questions, some of which required students to spend as much as five minutes reasoning about and explaining their answers in words and diagrams.

Each booklet in the national and Trial State Assessments included three student background questionnaires. The first, consisting of general background questions, included questions about race/ethnicity, mother's and father's level of education, reading materials in the home, homework, attendance, academic expectations, and which parents lived at home. The second, consisting of mathematics background questions, included questions about instructional activities, courses taken, use of specialized resources such as calculators in mathematics class, and views on the utility and value of the subject matter. Students were given five minutes to complete each questionnaire, with the exception of the fourth graders, who were given more time because the items in the general questionnaire were read aloud for them. The third questionnaire, newly developed for 1992, followed the three cognitive blocks and contained five questions about students' motivation to do well on the assessment, their perceptions concerning the difficulty of the assessment, and their familiarity with types of questions included.

Teacher and School Questionnaires

As part of the 1992 mathematics assessment, including the Trial State Assessment Program, questionnaires were given to the mathematics teachers of the fourth- and eighth-grade students participating in the assessment and to the principal or other administrator in each participating school. An expert panel developed guidelines for the school and teacher questionnaires focusing on five educational areas: instructional content, instructional practices and experiences, teacher characteristics, school conditions and contexts, and conditions beyond school (i.e., home support, out-of-school activities, and attitudes).²⁶ Similar to the development of the materials given to students, the policy guidelines and the teacher and school questionnaires were prepared through an iterative process that involved extensive development, field testing, and review by external advisory groups. The questionnaires for mathematics teachers consisted of two parts. The first requested information about the teacher, such as race/ethnicity and gender as well as academic degrees held, teaching certification, training in mathematics, and ability to get instructional resources. In the second part, teachers were asked to provide information on each class they taught that included one or more students who participated in the assessment. The information included, among other things, the amount of time spent on mathematics instruction and homework, the extent to which textbooks or worksheets were used, the instructional emphasis placed on different mathematical topics, and the use of various instructional approaches. Because the sampling for the questionnaires was based on participating students, the responses to the mathematics teacher questionnaire do not necessarily represent all fourth- or eighth-grade mathematics teachers in the nation, or in a state or territory. Rather, they represent teachers of the representative sample of students assessed.

The extensive school questionnaire completed by principals or other administrators in the participating schools at all three grades, including the Trial State Assessment schools at grades 4 and 8, contained questions about the experience of individuals completing the questionnaire, school policies, course offerings, and special priority areas and resources, among other topics.

It is important to note that in this report, as in all NAEP reports, the student is always the unit of analysis, even when information from the teacher or school questionnaire is being reported. Using the student as the unit of analysis makes it possible to describe the instruction received by representative

²⁶National Assessment of Educational Progress, 1992 *Policy Information Framework* (Princeton, NJ: National Assessment of Educational Progress, Educational Testing Service, 1992).

samples of students. Although this approach may provide a different perspective from that obtained by simply collecting information from teachers or schools, it is consistent with NAEP's goal of providing information about the educational context and performance of students.

National Sampling

Sampling and data collection activities for the 1992 NAEP assessment were conducted by Westat, Inc. As with all NAEP national assessments, the results for the national samples were based on a stratified, three-stage sampling plan. The first stage included defining geographic primary sampling units (PSUs), which are typically groups of contiguous counties, but sometimes a single county; classifying the PSUs into strata defined by region and community type; and randomly selecting PSUs. For each grade, the second stage included listing, classifying, and randomly selecting schools, both public and private, within each PSU selected at the first stage. The third stage involved randomly selecting students within a school for participation. Some students who were selected (fewer than 6 percent) were excluded because of limited English proficiency or severe disability. In 1984, NAEP began collecting descriptive information on these excluded students in order to describe this group more fully. Further information about excluded students will be available in the *NAEP 1992 Technical Report*. The criteria for excluding students are provided in a subsequent section of this Appendix.

In 1992, the assessment was conducted from January through March, with some make-up sessions in early April. In 1990, the sample at each grade consisted of two equivalent half samples. The assessment was administered to the first half sample in the January to mid-March time frame, while it was administered to the second half sample in the mid-March to mid-May time frame. The first half sample from 1990 was used for trend purposes to provide a more precise basis for comparison in terms of the time of year of the assessment.

TABLE D.3 presents the student and school sample sizes and the cooperation and response rates for the national assessments.

TABLE D.3 Student and School Sample Sizes, 1992 and 1990

Grade	Number of Participating Schools		Percent of Schools Participating		Number of Students		Percent of Student Completion	
	1992	1990	1992	1990	1992	1990	1992	1990
4	527	527	86	88	8,738	8,902	93	93
8	406	406	84	87	9,432	8,888	89	89
12	304	304	81	81	8,499	8,862	81	81
Total	1,237	1,237			26,669	26,472		

Although sampled schools that refused to participate were occasionally replaced, school cooperation rates were computed based on the schools originally selected for participation in the assessments. The rates, which are based on schools sampled for all subjects assessed in 1992 (reading, writing, and mathematics) and 1990 (reading, science, and mathematics), are also the best estimates for the mathematics assessment. The student completion rates represent the percentage of students assessed of those invited to be assessed in mathematics, including those assessed in follow-up sessions, when necessary. In 1992, the BIB-spiraled portion of the assessment (13 blocks, 26 booklets) was administered to 7,176 students at grade 4; 7,663 students at grade 8; and 6,973 students at grade 12. In 1990, of the participating schools, 790 were public schools, and 447 were Catholic and other private schools. In 1992, 944 were public schools, and 638 were Catholic and other private schools.

Trial State Assessment Sampling

Identical to the procedures used for the 1990 Trial State Assessment Program at grade 8, for the 44 jurisdictions participating in the 1992 Program including both grades 4 and 8, the basic design was to select a sample of 100 public schools from each state, with a sample of 30 students drawn from each school. In the eighth grade, up to three sessions (90 students) were selected from large schools to better represent this school type. For states with small numbers of schools, and no or very small schools, all schools were included in the sample with certainty. In the fourth grade, all the eligible fourth-grade schools in the

District of Columbia, Delaware, and Guam were taken into the sample with certainty. In the eighth grade, all the eligible schools were taken from the District of Columbia, Delaware, Hawaii, Rhode Island, Guam, and the Virgin Islands.

In states where a sample of schools was drawn, schools were stratified by urbanicity, minority strata (which varied by state and urbanicity level), and median income. Special procedures were used for small schools and for identifying and including new schools in the sampling frame for each jurisdiction. To minimize the potential for nonresponse bias, substitutes for nonparticipating schools were selected on a one-by-one basis to be similar to the original school in terms of urbanicity, percent Black enrollment, percent Hispanic enrollment, median household income, and total fourth- or eighth-grade enrollment. Furthermore, the substitute school was selected from the same district whenever possible.

A systematic equal probability sample of the desired number of students (usually 30, but sometimes more) was drawn from each school, yielding a sample size in excess of 2,500 students for each participating state and territory. The state assessments were conducted during February.

Full information about school and student participation rates for each state (including the District of Columbia) and territory is contained in Appendix B. Appendix B also contains comparable information for the national and regional subsamples used in this report as a basis for comparison to states and territories. More specifically, these results are based only on students attending public schools (not private schools).

Excluded Students

It is NAEP's intent to assess all selected students. Therefore, all selected students who are capable of participating in the assessment should be assessed. However, some students sampled for participation in NAEP are excluded from the sample according to carefully defined criteria. Specifically, some of the students identified as having Limited English Proficiency (LEP) or having an Individualized Education Plan (IEP) may be incapable of participating meaningfully in the assessment. These students are identified as follows:

LEP students may be excluded if:

- The student is a native speaker of a language other than English; AND
- He or she has been enrolled in an English-speaking school for less than two years; AND
- The student is judged to be incapable of taking part in the assessment.

IEP students may be excluded if:

- The student is mainstreamed less than 50 percent of the time in academic subjects and is judged to be incapable of taking part in the assessment, OR
- The IEP team has determined that the student is incapable of taking part meaningfully in the assessment.

When there is doubt, the student is included in the assessment.

For each student excluded from the assessment, including those in the 1990 and 1992 Trial State Assessment Programs, school personnel complete a questionnaire about the characteristics of that student and the reason for exclusion.

Data Collection

As with all NAEP assessments, data collection for the 1992 assessment was conducted by a trained field staff. For the national assessment, this was accomplished by Westat staff. However, in keeping with the legislative requirements of the Trial State Assessment Program, the state mathematics assessments involving approximately 111,000 fourth graders and 109,000 eighth graders in about 9,000 schools were conducted by personnel from each of the participating states. NAEP's responsibilities included selecting the sample of schools and students for each participating state, developing the administration procedures and manuals, training the personnel who would conduct the assessments, and conducting an extensive quality assurance program.

Each participating state and territory was asked to appoint a State Coordinator to be the liaison between NAEP and participating schools. The State Coordinator was asked to gain cooperation of the selected schools, assist in scheduling, provide information necessary for sampling, and notify personnel about training. At the local school level, the administrators, usually school or district staff, were responsible for attending training, identifying excluded students, distributing school and teacher questionnaires, notifying sampled students and their teachers, administering the assessment session, completing the necessary paperwork, and preparing the materials for shipment.

Westat staff trained assessment administrators within the states in three and one-half hour sessions that included a videotape and practice exercises to provide uniformity in procedures. Almost 10,000 persons who were to be assessment administrators were trained in about 500 training sessions around the nation.

To provide quality control across states, a randomly selected 50 percent of the state assessment sessions were monitored by approximately 400 quality control monitors, who were also trained Westat staff. The identity of the schools to be monitored was not revealed to state, district, or school personnel until shortly before the assessment was to commence. The analysis of the results for the unmonitored schools as compared to the monitored schools yielded no systematic differences that would suggest different procedures were used. See the *Technical Report for the 1992 Trial State Mathematics Assessment* for details and results of this analysis.

Scoring

Materials from the 1992 assessment, including the Trial State Assessment Program, were shipped to National Computer Systems in Iowa City for processing. Receipt and quality control were managed through a sophisticated bar-coding and tracking system. After all appropriate materials were received from a school, they were forwarded to the professional scoring area, where the responses to the open-ended items were evaluated by trained staff using guidelines prepared by NAEP. Each open-ended question had a unique scoring guide that defined the criteria to be used in evaluating students' responses. Of the regular constructed-response items, some were scored right/wrong, but the majority included several different categories of correct and incorrect responses. The extended constructed-response questions were evaluated on a scale of 1 to 5, permitting degrees of partial credit to be given. For the national mathematics

assessment and the Trial State Assessment Program approximately 4 million students responses were scored, including a 20 percent reliability sample. The overall percentage of agreement between readers for both the national and trial state assessment reliability samples was 94 percent. For the constructed-response questions contained in the trend blocks, training was conducted using materials and scoring guides identical to those used for the 1990 assessment. To provide information about reliability between assessment years, 100 booklets from each of the 40 states that participated in the 1990 Trial State Assessment Program were chosen at random to be scored again in 1992. Based on the 4,000 responses to each of the 25 questions rescored in 1992, the exact percentage of agreement was 96 percent. Subsequent to the professional scoring, the booklets were scanned, and all information was transcribed to the NAEP database at ETS. Each processing activity was conducted with rigorous quality control.

Data Analysis and IRT Scaling

After the assessment information had been compiled in the database, the data were weighted according to the population structure. The weighting for the national and state samples reflected the probability of selection for each student as a result of the sampling design, adjusted for nonresponse. Through poststratification, the weighting assured that the representation of certain subpopulations corresponded to figures from the U.S. Census and the Current Population Survey.²⁷

Analyses were then conducted to determine the percentages of students who gave various responses to each cognitive and background question. Item response theory (IRT) was used to estimate average proficiency for the nation, various subgroups of interest within the nation, and for the states and territories.

IRT models the probability of answering an item correctly as a mathematical function of proficiency or skill. The main purpose of IRT analysis is to provide a common scale on which performance can be compared across groups, such as those defined by grades, and subgroups, such as those defined by race/ethnicity or gender. Because of the BIB-spiraling design used by NAEP, students do not receive enough questions about a specific topic to provide reliable information about individual performance. Traditional test scores for individual students, even those based on IRT, would lead to misleading estimates of

For additional information about the use of weighting procedures in NAEP, see Eugene G. Johnson, "Considerations and Techniques for the Analysis of NAEP Data" in *Journal of Educational Statistics* (December 1989).

population characteristics, such as subgroup means and percentages of students at or above a certain proficiency level. Instead, NAEP constructs sets of plausible values designed to represent the distribution of proficiency in the population. A plausible value for an individual is not a scale score for that individual but may be regarded as a representative value from the distribution of potential scale scores for all students in the population with similar characteristics and identical patterns of item response. Statistics describing performance on the NAEP proficiency scale are based on these plausible values. They estimate values that would have been obtained had individual proficiencies been observed--that is, had each student responded to a sufficient number of cognitive items so that proficiency could be precisely estimated.²⁸

For the 1992 assessment, a scale ranging from 0 to 500 was created to report performance for each content area. The scales summarize examinee performance across all three item types used in the assessment (multiple-choice, regular constructed-response, and extended constructed-response). In producing the scales, three distinct IRT models were used. Multiple-choice items were scaled using the three-parameter logistic model; regular constructed-response items were scaled using the two-parameter logistic model; and the extended constructed-response items were scaled using a generalized partial-credit model. Each content-area scale was based on the distribution of student performance across all three grades assessed in the 1990 national assessment (grades 4, 8, and 12) and had a mean of 250 and a standard deviation of 50. A composite scale was created as an overall measure of students' mathematics proficiency. The composite scale was a weighted average of the five content area scales, where the weight for each content area was proportional to the relative importance assigned to the content area in the specifications developed by the Mathematics Objectives Panel as shown in previously in TABLE D.1.

As described earlier, the NAEP proficiency scales make it possible to examine relationships between students' performance and a variety of background factors measured by NAEP. The fact that a relationship exists between achievement and another variable, however, does not reveal the underlying cause of the relationship, which may be influenced by a number of

²⁸ For theoretical justification of the procedures employed, see Robert J. Mislevy, ETS Research Report *Randomization-Based Inferences About Latent Variables from Complex Samples*, "Psychometrika, 56(2), 177-196. Service, 1988).

For computational details, see *Focusing the New Design: NAEP 1988 Technical Report* (Princeton, NJ: Educational Testing Service, National Assessment of Education Progress, 1990) and the *1990 NAEP Technical Report*.

other variables. Similarly, the assessments do not capture the influence of unmeasured variables. The results are most useful when they are considered in combination with other knowledge about the student population and the educational system, such as trends in instruction, changes in the school-age population, and societal demands and expectations.

Linking the Trial State Results to the National Results

Although the assessment booklets used in the Trial State Assessment Program were identical to those used in the national assessment, the various differences between the national and trial state assessments, including those in administration procedures, required that careful and complex equating procedures based on a special design be used to create an appropriate basis for comparison between the national and state results.

The results from the Trial State Assessment were linked to those from the national assessment through a linking function determined by comparing the results for the aggregate of students assessed in the Trial State Assessment (except those in Guam and the Virgin Islands) with the results for students in the State Aggregate Comparison subsample of the national assessment. This subsample is representative of the population of all grade-eligible public-school students within the aggregate of the 41 participating states and the District of Columbia who were assessed as part of the national assessment.

The linking was accomplished for each subscale by matching the mean and standard deviation of the subscale proficiencies across all students in the Trial State Assessment (excluding Guam and the Virgin Islands) to the corresponding subscale mean and standard deviation across all students in the State Aggregate Comparison subsample.

Reanalysis of 1990 Results

An enhanced version of the statistical procedures employed in 1990 was used to obtain results for the 1992 mathematics assessment. Preliminary research with simulated data and experience with selected reanalyses of previously reported 1990 NAEP data sets suggested that small, but consistent, differences in the results produced by the two sets of procedures would be obtained. The nature and magnitude of such differences would have little or no effect on state-to-state and state-to-nation comparisons. However, certain within-state comparisons between 1992 and 1990 would be affected to a degree that is not

ignorable. In order to maintain the integrity of the 1990 NAEP mathematics scales for trend analysis, a decision was made to reanalyze the 1990 results and report revised figures. The 1990 estimates given in the 1992 NAEP mathematics reports, including the present report, are based on the reanalyzed 1990 results. In the vast majority of cases, the reanalyzed results will differ trivially, if at all, from those originally reported and the magnitudes of the differences between the original and reanalyzed results rarely exceed a standard error. Slightly larger, but still modest, differences between the original and reanalyzed results may be observed for the composite scale standard deviations and proportions of students at or above NAEP anchor levels. Since the process of setting achievement levels was newly conducted for 1992, these figures will also differ from results published in 1990.

Effects of Excluded and Absent Students

The aim of NAEP is to collect performance and other information about the students assessed and from these draw inferences to the characteristics of all students in a variety of populations, such as the grade 4 students in the United States. Although survey sampling techniques are used to draw samples of students that are representative of the populations of interest, not all students selected for the assessment actually participate.

Certain selected students are judged by school authorities as being incapable of meaningfully participating in the assessment. Students satisfying specific guidelines are allowed to be excluded from the assessment. Excluded students are a subset of those with an Individualized Education Plan or who are classified as Limited English Proficient for whom the assessment format would not permit a meaningful evaluation of their proficiency. Consequently, the assessment results pertain only to the population of students who, if selected, would not be excluded from the assessment.

In addition to students excluded from the assessment, other students will be absent from the assessment session. Absent students include those who left the session too early or arrived too late to take most of the assessment, those at school during the day of the assessment who failed to attend the session, and students absent from school due to illness, truancy, or other planned or unplanned absences. Absent students are included in the population to which proficiency measures pertain through the use of student-level nonresponse adjustments. These adjustments are made by forming weighting classes based on the characteristics of the students and of the schools they attend and then

inflating the sampling weights of the assessed students within each weighting class to reflect the contribution of the absent students within that class. The representativeness of the NAEP results depends on the extent to which absent and assessed students within the same weighting class resemble each other in terms of their distributions of proficiency. Studies on the characteristics of absent students from various national assessments suggest that the bulk of the absent students do resemble the assessed students in terms of their proficiency.²⁹

The representativeness of the assessment results are thus determined by the percents of excluded and absent students and by their characteristics. An additional complication occurs when measuring changes in achievement over time. The interpretation of comparisons of achievement between two or more assessments depends on the comparability of the populations assessed at each point in time. For example, even if the proficiency distribution of the entire population at time 2 was unchanged from that at time 1, an increase in the rate of exclusion would produce an apparent gain in the reported average proficiencies between the two time points if the excluded students tend to be lower performers.

Tables D.4 and D.6 provide information about the potential effects of exclusion and absenteeism on the 1990 and the 1992 national mathematics results. Each table is for one of the grades 4, 8, or 12 and shows:

- 1) Selected percentiles of the distribution of overall mathematics proficiency for each year. These are the reported percentiles and are based only on the nonexcluded students with weighting class nonresponse adjustments for the absent students. Also included are the between-year differences in the percentiles.
- 2) The percentages of students excluded or absent from the assessment for each year.
- 3) Recomputed percentiles for the distribution of all students (assessed, excluded, and absent) under the assumption that all excluded and all absent students, had they been assessed, would have scored below the 25th percentile of all students. The selected students original sampling weights (before nonresponse adjustment) were used in these calculations. These percentiles provide a lower bound to what the actual percentiles would be if all students were assessed.

²⁹Keith F. Rust and Eugene G. Johnson, Sampling and Weighting in the National Assessment, *Journal of Educational Statistics*, 1992, 111-129.

The tables show that the exclusion rates increased between 1990 and 1992 at all three grades but that the absentee rate decreased. As is to be expected, the combined impact of assuming all excluded and absent students would score below the 25th percentile is to reduce the percentiles, with the greatest reduction occurring for the lower percentiles. More to the point for the measurement of change across time is that the between-year differences in the recomputed percentiles are generally close to the between-year differences for the reported percentiles, particularly for grades 4 and 8, and especially when the standard errors of the percentiles are taken into account. Consequently, changes in exclusion and absentee rates generally had minimal impact on the measurement of changes in the distribution of proficiency between 1990 and 1992.

TABLE D.4 Percentiles of Overall Mathematics Proficiency Under Two Treatments of Excluded and Absent Students, Grade 4

	A: Percentiles for nonexcluded students with nonresponse adjustment for absent students*					Percent	
	25th	50th	75th	90th	95th	excluded	absent

NAEP Reporting Groups

This report contains results for the nation, participating states, and groups of students within the nation and states defined by shared characteristics. The definitions for subgroups as defined by race/ethnicity, size and type of community, parents' education level, gender, and region follow.

Race/Ethnicity. Results are presented for students of different racial/ethnic groups based on the students' self-identification of race/ethnicity according to the following mutually exclusive categories: White, Black, Hispanic, Asian/Pacific Islander, and American Indian (including Alaskan Native). Based on criteria described in the following section, at least 62 students in a particular subpopulation must participate in order for the results for that subpopulation to be considered reliable. State results for racial/ethnic groups with fewer than 62 students are not reported. For the nation, some racial/ethnic group results are not reported for background variables, because this further breakdown results in too few students. However, the data for all students, regardless of whether their racial/ethnic group was reported separately, were included in computing the overall national or state level results.

Type of Community. Results are provided for four mutually exclusive community types -- advantaged urban, disadvantaged urban, extreme rural, and other -- as described below. According to information about parents' occupation obtained from the Principal's Questionnaire completed by each sampled school, indices are developed such that for each assessment approximately the 10 percent of the most extreme advantaged urban, disadvantaged urban, and rural schools are classified into the first three categories. The remaining approximately 70 percent of the schools are classified into the "other" category. Reporting of results by each type of community was subject to the procedure based on a minimum student sample size of 62.

Advantaged Urban: Students in this group reside in metropolitan statistical areas and attend schools where a high proportion of the students' parents are in professional or managerial positions.

Disadvantaged Urban: Students in this group reside in metropolitan statistical areas and attend schools where a high proportion of the students' parents are on welfare or are not regularly employed.

Extreme Rural: Students in this group do not reside in metropolitan statistical areas. They attend schools in areas with a population below 10,000 where many of the students' parents are farmers or farm workers.

Other: Students in the "Other" category attend schools in areas other than those defined as advantaged urban, disadvantaged urban, or extreme rural.

Because of the methods underlying the development of this background variable, the cutpoints for the indices defining approximately the most extreme 10 percent of the advantaged urban, disadvantaged urban, and rural schools can change from assessment to assessment. Thus, to see if this had an impact on the trends from 1990 to 1992, in particular, the significant decline in average proficiency for the eighth graders attending schools in disadvantaged urban communities, NAEP also analyzed the results using the 1990 indices. The findings are shown below in Table D.7.

TABLE D.7 Average Mathematics Proficiency by Type of Community Using 1990 Criteria

	Grade 4		Grade 8		Grade 12	
	Percentage of Students	Average Proficiency	Percentage of Students	Average Proficiency	Percentage of Students	Average Proficiency
Advantaged Urban						
1992 Using 1992 Index	12(1.8)	237(2.1)	10(1.8)	288(3.6)	12(2.1)	316(2.6)
1992 Using 1990 Index	12(1.8)	238(2.1)	13(1.9)	287(3.0)	12(2.1)	316(2.6)

> The value for 1992 was significantly higher than the value for 1990 at about the 95 percent confidence level. < The value for 1992 was significantly lower than the value for 1990 at about the 94 percent confidence level. ! Interpret with caution -- the nature of the sample does not allow accurate determination of the variability of this estimated statistic. The standard errors of the estimated percentages and proficiencies appear in parentheses. It can be said with 94 percent certainty for each population of interest, the value for the whole population is within plus or minus two standard errors of the estimate for the sample. In comparing two estimates, one must use the standard error of the difference (see Appendix for details).

The results show that average proficiency by type of community in 1992 was virtually the same regardless of which method was used to determine the index cutpoints at both grades 4 and 12. However, at grade 8, for students attending schools in disadvantaged urban areas the average proficiency differs by the approach to defining the variable. Using the criteria of approximately the 10 percent extreme disadvantaged urban schools, there was a decline in average proficiency for these students between 1990 and 1992. Using the same criteria as were used in 1990 there appeared to be a larger (but not statistically significant) percentage of students attending schools in disadvantaged urban communities, and as a whole, their average proficiency was about the same between the two assessments. Nevertheless, for the most extreme percentage of students, they were more disadvantaged according to the NAEP criteria and had lower average mathematics proficiency.

Parents' Education Level. Students were asked to indicate the extent of schooling for each of their parents -- did not finish high school, graduated high school, had some education after high school, or graduated college. The response indicating the higher level of education for either parent was selected for reporting.

Gender. Results are reported separately for males and females. Gender was reported by the student.

Region. The United States has been divided into four regions: Northeast, Southeast, Central, and West. States in each region are shown on the following map.

Minimum Subgroup Sample Sizes

As described earlier, results for mathematics proficiency and background variables were tabulated and reported for groups defined by race/ethnicity and type of community, as well as by gender and parents' education level. However, in many states or territories and for some regions of the country, the number of students in some of these population subgroups was not sufficiently high to permit accurate estimation of proficiency and/or background variable results. As a result, data are not provided for the subgroups with very small sample sizes. For results to be reported for any subgroup, a minimum sample size of 62 students was required. This number was determined by computing the sample size required to detect an effect size of .2 at the 5 percent significance level, with a probability of .8 or greater.

Estimating Variability

Because the statistics presented in this report are estimates of group and subgroup performance based on samples of students, rather than the values that could be calculated if every student in the nation answered every question, it is important to have measures of the degree of uncertainty of the estimates. Two components of uncertainty are accounted for in the variability of statistics based on proficiency: the uncertainty due to sampling only a relatively small number of students and the uncertainty due to sampling only a relatively small number of mathematics questions. The variability of estimates of percentages of students having certain background characteristics or answering a certain cognitive question correctly is accounted for by the first component alone.

In addition to providing estimates of percentages of students and their proficiency, this report also provides information about the uncertainty of each statistic. Because NAEP uses complex sampling procedures, conventional formulas for estimating sampling variability that assume simple random sampling are inappropriate and NAEP uses a jackknife replication procedure to estimate standard errors. The jackknife standard error provides a reasonable measure of uncertainty for any information about students that can be observed without error, but each student typically responds to so few items within any content area that the proficiency measurement for any single student would be imprecise. In this case, using plausible values technology makes it possible to describe the performance of groups and subgroups of students, but the underlying imprecision

that makes this step necessary adds an additional component of variability to statistics based on NAEP proficiencies.³⁰

The reader is reminded that, like all surveys, NAEP results are also subject to other kinds of errors including the effects of necessarily imperfect adjustment for student and school non-response and other largely unknowable effects associated with the particular instrumentation and data collection methods used. Nonsampling errors can be attributed to a number of sources: inability to obtain complete information about all selected students in all selected schools in the sample (some students or schools refused to participate, or students participated but answered only certain items); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct information, mistakes in recording, coding, or scoring, data; and other errors of collecting, processing, sampling, and estimating missing data. The extent on nonsampling errors is difficult to estimate. By their nature, the impacts of such error cannot be reflected in the data-based estimates of uncertainty provided in NAEP reports.

Achievement Levels

Setting achievement levels is a method for setting standards on the NAEP assessment that identifies what students should know and should be able to do at various points along the proficiency scale. The method depends on securing and summarizing a set of judgmental ratings of expectations for student educational performance on specific items. The NAEP proficiency scale is a numerical index of students' performance in mathematics ranging from 0 to 500 and has 3 achievement levels-Basic, Proficient, and Advanced-mapped onto it for each grade level assessed.

In developing the threshold values for the levels, a broadly constituted panel of 68 judges-including 50 percent teachers, 20 percent non-teacher educators, and 30 percent non-educators-rated a grade-specific item pool using the Board's policy definitions for Basic, Proficient, and Advanced.³¹ The policy definitions are as follows:

- ◆ **BASIC**—This level, below proficient, denotes partial mastery of the knowledge and skills that are fundamental for proficient work at each grade.

³⁰For further details, see Eugene G. Johnson, "Considerations and Techniques for the Analysis of NAEP Data" in *Journal of Educational Statistics* (December 1989).

³¹Non-educators represented business, labor, government service, parents, and the general public.

- ♦ **PROFICIENT**—This central level represents solid academic performance for each grade tested. Students reaching this level have demonstrated competency over challenging subject matter and are well prepared for the next level of schooling.
- ♦ **ADVANCED**—This higher level signifies superior performance beyond proficient grade-level mastery at each grade.

The policy definitions were operationalized by the judges in terms of specific mathematical skills, knowledge, and behaviors that were in accordance with the current mathematics assessment framework, and were generally agreed to be appropriate expectations for students in each grade at each level (See Chapter One). The judges' operationalized definitions were incorporated into lists of descriptors that represented what borderline students should be able to do at each of the policy levels. The purpose of having panelists develop their own operational definitions of the achievement levels was to ensure that all panelists would have a common understanding of borderline performances and a common set of content-based referents to use during the item rating process.

The judges (24 at grade 4, 22 at grade 8, and 22 at grade 12) each rated half of the items in the NAEP pool in terms of the expected probability that a student at a borderline achievement level would answer the item correctly, based on the judges' operationalization of the policy definitions and the factors that influence item difficulty. To assist the judges in generating consistently-scaled ratings, the rating process was repeated twice, with feedback. Information on consistency among different judges and on the difficulty of each item³² was fed back into the first repetition (round 2), while information on consistency within each judge's set of ratings was fed back into the second repetition (round 3). The third round of ratings permitted the judges to discuss their ratings among themselves to resolve problematic ratings. The mean final rating of the judges aggregated across items yielded the threshold values in the percent correct metric. These cut scores were then mapped onto the NAEP scale (which is defined and scored using item response theory, rather than percent correct) to obtain the scale scores for the achievement levels. The judges' ratings, in both metrics, and their associated errors of measurement are shown below in TABLE D.8. The Board accepted the panel's achievement levels and, for reporting purposes, set final cutpoints one standard error (a measure of consistency among the judges ratings) below the mean levels.

³²Item difficulty estimates were based on a preliminary, partial set of responses to the national assessment.

TABLE D.8 **Cutpoints for Achievement Levels**

Grade	Level	Mean Percent Correct (Round 3)	Scale Score (From Mean Percents)	Standard Error of Scale Score	Scale Score Cutpoint for Reporting
4	Basic	39	213	1.9	211
4	Proficient	65	252	4.1	248
4	Advanced	84	284	4.0	280
8	Basic	48	258	2.4	256
8	Proficient	71	300	5.7	294
8	Advanced	87	336	4.8	331
12	Basic	44	291	4.2	287
12	Proficient	70	335	0.2	334
12	Advanced	88	367	0.7	366

After the ratings were completed, the judges for each grade level reviewed the operationalized descriptions developed by the judges of the other grade levels as well as their own descriptions and came up with achievement level descriptions that were generally acceptable to all three grade-group judges. However, the descriptions varied in format, sharpness of the language, and degree of specificity of the statements. Therefore, another panel at a subsequent validation meeting improved the wording and modified the language of the achievement level descriptions to reflect more closely the terminology of the *NCTM Standards* for mathematics.³³

Finally, for each achievement level, exemplar items needed to be selected that reflected the kinds of tasks that examinees at or above the level were likely to be able to perform successfully. While the judges discussed items and made recommendations, the task of final selection was put to a subsequent validation panel. Several criteria were used to select items as candidates for exemplars. From the pool of items scheduled for public release, items were deleted that students were more likely to get wrong than right ($p\text{-value} \leq .50$). Remaining items that did not match any of the descriptions were also deleted. A few items were deleted that did not have increasing p -values from Basic, to Proficient, to Advanced. The validation panels then reviewed the matched and classified item sets and selected exemplars based on the quality of the items, the way the items collectively represented the subscales, and the appropriateness of the items to the

³³National Council of Teachers of Mathematics, *Curriculum and Evaluation Standards for School Mathematics*, (Reston, VA: National Council of Teachers of Mathematics, 1989).

grade (for items administered to more than one grade). In Chapter One, FIGURES 1.1 through 1.3 provide the final descriptions of the three achievement levels for each grade, along with exemplar items to illustrate what students at each level should be able to perform. In principle, the descriptions of the levels, though based on the 1992 item pool, apply to the current assessment framework and will not change from year to year (that is, until the framework changes). However, the sample items reflective of the levels will need to be updated each time the assessment is administered.

Scale Anchoring

As implemented for the 1990 and 1992 mathematics assessments, NAEP's scale anchoring procedure was based on comparing item-level performance by students at four levels on the 0 to 500 mathematics composite scale -- Levels 200, 250, 300, and 350.³⁴ In brief, the analyses delineated four sets of about 50 anchor items each that discriminated between adjacent performance levels on the scale.³⁵ The four sets of empirically derived anchor items were studied by panels of mathematics educators who carefully considered and articulated the types of knowledge, skills, and reasoning abilities that were demonstrated by correct responses to the items in each set. These descriptions, together with example anchor items, are then used in conjunction with the percentages of students performing at or above the four levels to convey a concise interpretation of the scale results.

To provide a sufficient pool of respondents at each anchor level for the analyses, students performing at Level 200 on the scale were more broadly defined as those whose estimated mathematics proficiency was between 187.5 and 212.5, students at 250 were defined as those with estimated proficiency between 237.5 and 262.5, those at 300 had estimated proficiencies between 287.5

³⁴Ina V.S. Mullis, John A. Dossey, Eugene H. Owen, and Gary W. Phillips, *The State of Mathematics Achievement, NAEP's 1990 Assessment of the Nation and the Trial Assessment of the States* (Washington, D.C.: U.S. Department of Education, 1991).

Ina V.S. Mullis, John A. Dossey, Eugene H. Owen, and Gary W. Phillips, *The 1992 Mathematics Report Card* (Washington, D.C.: U.S. Department of Education, 1993).

Albert E. Beaton and Nancy L. Allen, "Interpreting Scales through Scale Anchoring," *Journal of Educational Statistics*, 1992, 17, pp. 191-204.

³⁵In 1992, 22 items anchored at Level 200 and another 8 almost anchored (also considered, since they nearly satisfied the anchoring criteria), at Level 250 there were 45 anchor items and 27 that almost anchored, at Level 300 there were 59 anchor items and 29 that almost anchored, and at Level 350 there 43 items and 34 that almost anchored. Of the 432 items included in the process, 165 did not anchor. In 1990, the totals of anchored and almost anchored items were: 43 at Level 200, 46 at Level 250, 64 at Level 300, and 43 at Level 350. Of the 275 items used in the process, 79 did not anchor.

and 312.5, and those at 350 between 337.5 and 362.5. In theory, anchor levels above 350 or below 200 could have been described; however, so few students in the assessment performed at the extreme ends of the scale that it was not possible to do so.

After identifying the fourth, eighth, and twelfth graders performing at the four anchor levels on the scale, two kinds of information were computed for these students for each item -- the actual number of students at each of the levels included in the analysis and the percentage of them who answered the item correctly (weighted in accordance with the sampling design). Thus, for each item, a p-value is computed separately for the students performing at each anchor level (four p-values for each item, as shown later in this section). These analyses were performed for each grade level at which the item was administered, and for the grade levels combined, if the item was administered at more than one grade level.

Based on the p-values for each anchor level, the following criteria were used to identify the items that discriminated between scale levels; that is, the items that students at one anchor level were more likely to answer correctly than were students at the next lower level.

Because it was the lowest level being defined, Level 200 was not analyzed in terms of the next lower level, but was examined for the percentage of students at that level answering the item correctly. More specifically, for an item to anchor at Level 200:

- 1) At least 65 percent of the students at Level 200 got the item right.
- 2) At least 100 students were available for the analysis.

The first criterion was established so that items associated with a level were those for which students at that level would have demonstrated at least some degree of success (at least 65 percent or about two-thirds), and therefore, those above the level would have an even higher degree of success. The second criterion provides stability for the p-value estimates.

For an item to anchor at the remaining levels, additional criteria had to be met. For example, to anchor at Level 250:

- 1) Sixty-five percent or more of the students at Level 250 got the item right.
- 2) At least 30 percent fewer students at Level 200 than at Level 250 got the item right.
- 3) At least 50 percent of the students at Level 200 got the item wrong.
- 4) At least 100 students at both Levels 200 and 250 were available for the analysis.

The same principles were used to identify anchor items at Levels 300 and 350. With the additional criteria, NAEP was trying to find items fairly likely to be answered correctly by students at one level, but unlikely at the levels below. Essentially, for any given anchor item, students at the anchor level are likely to answer the question correctly (65 percent or more likely), while those at the next lower level are less likely to answer the question correctly (at least 30 percent less likely). Also, students at the next lower level are somewhat likely to get the item wrong (at least half of them). Collectively, as identified through this procedure, the mathematics items at each anchor level represented advances in students' understandings from one level to the next -- mathematical topics where students at that level were more likely to answer items correctly than were students at the next lower level.

In preparation for use by panelists, the items were assembled with their full anchoring documentation and scoring guide (for open-ended items) and placed in notebooks by anchor-level order concluding with the "did not anchor" items. Within anchor level, the items were arranged in accordance with the classifications contained in the objectives framework. From 15 to 20 panelists, representing mathematicians; mathematics educators at the college, secondary, and elementary levels; and state and district mathematics supervisors; met for three days to systematically identify the mathematical knowledge, understanding, and problem-solving abilities demonstrated by the students in answering each item correctly. These descriptions were then summarized to develop the characterizations of performance for each anchor level. After being briefed in the anchoring process and given their assignment, panelists worked independently in two groups to analyze the items, draft their descriptions of performance for each anchor level, and select illustrative items to support their descriptions. On

the third day, panelists and staff worked together as a whole to combine the two independently derived sets of descriptions.

Each of the two times this process was used, both groups agreed that the two drafts were very similar. However, the cross-validation process is helpful and permits more individuals to be involved in the process. It also should be noted that although the 1992 assessment was designed to measure trends from 1990, the anchoring process was conducted to update the descriptions to reflect some evolution in the 1992 items. Some items in the 1992 assessment had been carried forward from 1990, but others were newly developed measures of the mathematics framework intended to reflect improvements in ways of assessing mathematics achievement. Therefore, as anticipated, the 1992 descriptions are very similar to the 1990 descriptions, but there are variations.

Drawing Inferences from the Results

The use of *confidence intervals*, based on the standard errors, provides a way to make inferences about the population means and proportions in a manner that reflects the uncertainty associated with the sample estimates. An estimated sample mean proficiency ± 2 standard errors represents a 95 percent confidence interval for the corresponding population quantity. This means that with approximately 95 percent certainty, the average performance of the entire population of interest is within ± 2 standard errors of the sample mean.

As an example, suppose that the average mathematics proficiency of students in a particular group was 256, with a standard error of 1.2. A 95 percent confidence interval for the population quantity would be as follows:

$$\begin{aligned}\text{Mean} \pm 2 \text{ standard errors} &= 256 \pm 2 \cdot (1.2) = 256 \pm 2.4 = \\ &256 - 2.4 \text{ and } 256 + 2.4 = 253.6, 258.4\end{aligned}$$

Thus, one can conclude with 95 percent certainty that the average proficiency for the entire population of students in that group is between 253.6 and 258.4.

Similar confidence intervals can be constructed for percentages, provided that the percentages are not extremely large (greater than 90) or extremely small (less than 10). For extreme percentages, confidence intervals constructed in the above manner may not be appropriate, however, procedures for obtaining accurate confidence intervals are quite complicated. Thus, comparisons involving extreme percentages should be interpreted with this in mind.

To determine whether there is a real difference between the mean proficiency (or proportion of a certain attribute) for two groups in the population, one needs to obtain an estimate of the degree of uncertainty associated with the

difference between the proficiency means or proportions of these groups for the sample. This estimate of the degree of uncertainty -- called the standard error of the difference between the groups -- is obtained by taking the square of each group's standard error, summing these squared standard errors, and then taking the square root of this sum.

Similar to the manner in which the standard error for an individual group mean or proportion is used, the standard error of the difference can be used to help determine whether differences between groups in the population are real. The difference between the mean proficiency or proportion of the two groups ± 2 standard errors of the difference represents an approximate 95 percent confidence interval. If the resulting interval includes zero, there is insufficient evidence to claim a real difference between groups in the population. If the interval does not contain zero, the difference between groups is statistically significant (different) at the .05 level.

The procedures described in this section, and the certainty ascribed to intervals (e.g., a 95 percent confidence interval) are based on statistical theory that assumes that only one confidence interval or test of statistical significance is being performed. When one considers sets of confidence intervals, like those for the average proficiency of all participating states and territories, statistical theory indicates that the certainty associated with the entire set of intervals is less than that attributable to each individual comparison from the set. If one wants to hold the certainty level for a specific set of comparisons at a particular level (e.g., .95), adjustments (called multiple-comparisons procedures) need to be made. One such procedure -- the Bonferroni method -- was used to form confidence intervals for the differences between the average proficiency of states that became the basis of the "higher than, same as, and lower than" figures in Chapters One and Three.

The Bonferroni method was also implemented in determining significant differences across assessment years and among population subgroups of the national samples. Comparisons of proficiency means and comparisons of percentages above achievement levels were treated as separate comparison sets or families, as were comparisons of percentile locations as well as comparisons of proficiency means, percentages at or above achievement levels, and population percentages in each demographic subgroup. For comparisons of demographic subgroups a comparison set or family size was defined by the number of classifications within that variable. A more detailed description of the use of the Bonferroni procedure appears in the *Technical Report for the 1992 Trial State Mathematics Assessment*, including the conventions used in determining family size for the various types of tables contained in NAEP reports.

The standard errors for means and proportions reported by NAEP are statistics and subject to a certain degree of uncertainty. In certain cases, typically when the standard error is based on a small number of students or when the group of students is enrolled in a small number of schools, the amount of uncertainty associated with the standard errors may be quite large. Throughout this report, estimates of standard errors subject to a large degree of uncertainty are designated by the symbol "!". In such cases, the standard errors -- and any confidence intervals or significance tests involving these standard errors -- should be interpreted cautiously.

ACKNOWLEDGMENTS

This report is culmination of effort by hundreds of individuals who contributed their considerable expertise, energy, and creativity to NAEP's mathematics assessments, from developing and conducting the assessments to analyzing and reporting the results. Most importantly, NAEP is grateful to the students and school staff who made the assessments possible.

The mathematics assessments, including the Trial State Assessment Program, were truly a collaborative effort among staff from State Education Agencies, the National Center for Education Statistics (NCES), Educational Testing Service (ETS), Westat, and National Computer Systems (NCS). The program benefited from the contributions of hundreds of individuals at the state and local levels -- Governors, Chief State School Officers, State and District Test Directors, State Coordinators, and district administrators -- who tirelessly provided their wisdom, experience, and hard work.

The assessment was funded through NCES, in the Office of Educational Research and Improvement of the U.S. Department of Education. Emerson Elliott, Commissioner, provided consistent support and guidance. The staff -- particularly Gary Phillips, Eugene Owen, Stephen Gorman, Maureen Treacy, Andy Kolstad, and Sheida White -- worked closely and collegially with ETS, Westat, and NCS staff and played a crucial role in all aspects of the program.

The members of the National Assessment Governing Board (NAGB) and the NAGB staff provided advice and guidance throughout, and their contractor for setting achievement levels, American College Testing, provided advisory and analytic functions in setting the achievement levels.

The Chief State School Officers managed the National Assessment Planning Project that resulted in the mathematics framework and objectives for the assessment.

NAEP owes a debt of gratitude to the numerous panelist and consultants who worked so diligently on developing the assessment and providing a frame for interpreting the results, including those who helped create the objectives, develop the assessment instruments, set the achievement levels, and provide the anchoring descriptions.

Under the NAEP contract to ETS, Ina Mullis served as the Project Director. Stephen Koffler managed test development and state services. The mathematics test development team led by Chan Jones and Jeffrey Haberstroh, and including Gail Chapman, Jane Cupin, Patty Klag, Jean MacFarland, Jane Maroney, Pat Meier, Melissa White, and Beverly Whittington deserve special credit for their

dedication. NAEP also owes a debt of gratitude to The Mathematics Item Development and Mathematics Scale Anchoring Panels who worked so diligently on developing the assessment and providing a frame for interpreting the results.

Jules Goodison managed the operational aspects with the strong support of John Olson, who also provided invaluable help in managing state services and reporting. Sampling and data collection activities were carried out by Westat under the direction of Renee Slobasky, Nancy Caldwell, and Keith Rust. Printing, distribution, scoring, and processing activities were conducted by NCS, under the supervision of John O'Neill, Judy Moyer, Diane Smrdel, Lavonne Mohn, Brad Thayer, and Mathilde Kennel.

Mathematics and state design, statistical, psychometric procedures and implementation were led by John Mazzeo and Frank Jenkins under the direction of Eugene Johnson. John Barone managed the data analysis and computerized reporting systems. Within these endeavors, Robert Patrick and David Freund designed and implemented the table generation system, Jennifer Nelson the graphics, and Alfred Rogers the maps. David Freund and Edward Kulick performed the mathematics data analysis, assisted by Drew Bowker, Bruce Kaplan, Steve Isham, and Yim Fai Fong. Ina Mullis, John Dossey, Gary Phillips, and Eugene Owen wrote the text for the report. Many thanks are provided to the numerous reviewers, internal and external, who suggested improvements to successive drafts. Sharon Davis-Johnson with the assistance of Rosemary Loeb provided the excellent desk-top publishing skills essential to the project. Kent Ashworth, who also manages information services, coordinated the cover design and production of the report.
